Chapter 1

HAEC Simulator Documentation

The HAEC simulator is an open-source HPC framework written in C++ for simulations which are based on traces. Currently the framework supports simulations using one the following network models:

1. Practical Network Coding Model (PNC),
2. Dimension Order Routing Model (DOR),
3. Macro Flow Data Model (MFD).

So far, all implemented network models assume that there are no link contention, no link errors, and no link attackers. Detailed information about the network models can be found in the following article: "Analysis of parallel applications on a high performance - Low energy computer", F. M. Ciorba, T. Ilsche, E. Franz, S. Pfennig, C. Scheunert, U. Markwardt, J. Schuchart, D. Hackenberg, R. Schöne, A. Knüpfer, W. E. Nagel, E. A. Jorswieck, and M. S. Müller, in Proceedings of the Workshop on Unconventional High Performance Computing, 2014.

1.1 Configuring and Running the HAEC Simulator

In preparation for running the HAEC simulator, a so-called "mapping file" has to be created which maps the process ids of the parallel application to the system nodes of the used grid topology. The format of the mapping file is as follows:

```
<Name of the mapping>
x_coordinate y_coordinate z_coordinate number_of_processes process_id(s)
0 0 2 38 72
1 0 0 2 3 73
[...]
2 2 2 4 35 51 75 77
```

The third row means: Application processes with MPI ranks 38 and 72 are mapped to the system node (0,0,0).

Then, the HAEC simulator can be configured by choosing one of the following ways:

1. "Semi-automatic configuration" by setting environment variables and executing a shell script.
2. "Manual configuration" by passing all command line options directly to the call of the HAEC simulator executable at the console.

1.1.1 Semi-Automatic Configuration

There will be a shell script named `haecsimrun.sh` available after the installation of the HAEC simulator. Program runs of the instrumented applications can be configured using the following environment variables prefixed by `HAECSIMRUN:`

- HAECSIMRUN_CONFIGURATION_FILE="" Configuration file using JSON style, default="haecsim.conf"
- HAECSIMRUN_COMMUNICATION_MODEL"<PNC/DOR/MFD>" Communication model. Practical network coding (PNC), Dimension order routing (DOR), Macro flow data (MFD), default=PNC
- HAECSIMRUN_TOPOLOGY="" Topology of the compute nodes, Currently, a grid topology is supported, only. default="3x3x3".
- HAECSIMRUN_LATENCY="" Latency of the link connections in ns (nano seconds), default="100"
- HAECSIMRUN_BANDWIDTH="" Bandwidth of the link connections in b/s (bits per second), default="12500000000" (100 GB/s)
- HAECSIMRUN_MAPPING_PROCS_TO_NODES="" File for mapping application processes to system nodes, default="positions.map"
- HAECSIMRUN_INPUTTRACE_DIR"<directory>" Input trace directory, default=". ."
- HAECSIMRUN_OUTPUT_DIR"<directory>" Output directory which serves a basis for trace files, default=". ."

After setting the environment variables the script `haecsimrun.sh` can be executed in order to run the simulation.

1.1.2 Manual Configuration

The HAEC simulator will be invoked from the command line. As it works in parallel, a new simulation has to be launched using `mpirun`:

```
mpirun -np <Nprocs> main/haec\_sim <inputtracefile.otf2>
```

The number of needed MPI processes `Nprocs` can be obtained by executing the following OTF2 command line tool and reading out the row locations:

```
otf2-print -I <inputtracefile.otf2>
```

Note

It is important to provide the correct number of MPI processes as there is no way to check this before the simulation starts. Otherwise, the HAEC simulator will crash during execution with the following exception:

```
otf2::exception: We have too few MPI processes to run.
```

There are several command line options. All options will be listed when launching the HAEC simulator without any arguments.

- `-o <outputtracefile>`
`--output-trace <outputtracefile>`

Path to output trace file. If no outputtracefile is given, then the default output trace file can be found in `BUILD/main/output_trace`.

- `-p <positionsmapfile>`
`--positions-map <positionsmapfile>`

Path to mapping file.

- `-c <configurationfile>`
`--config-file <configurationfile>`

Path to configuration file

- `--conf-override '<configuration option>:<JSON value>'`

Override the given configuration option

- `-V <level>`
`--verbosity <level>`

Verbosity of the messages during the simulation, where level is one of the following: trace, debug, info [default], warn, error, or fatal.

- `--no-zero-durations`

If this option is given, every function with a duration equal to zero will be stretched to 1 pico second.

Target system parameters are stored in a JSON configuration file. An example configuration file can be found at:

`etc/haec_sim.conf`

A nice online editor for the JSON format is available at:

<http://jsoneditoronline.org>

The JSON configuration path `.modules.static_network_model.communication_model` has to be set in order to ensure that each MPI point-to-point message in the input trace will be 'transmitted' using the desired network model. This can be done in two ways. The first way is to edit the configuration file, the second way is to use overrides:

```
--conf-override '.modules.static_network_model.communication_model:"PNC"'
--conf-override '.modules.static_network_model.communication_model:"DOR"'
--conf-override '.modules.static_network_model.communication_model:"MFD"'
```

Overriding configuration options is possible with the command line option `-conf-override` which can specified multiple times for multiple overrides

The overrides consist of a path, a colon, and a JSON expression. If one only wants to override one specific option in the configuration file one can simply pass the path to it with the new value. For example, if one wants to set a different value for the latency, then a correct override would be:

```
-conf-override '.modules.static_network_model.latency:50000'
```

One can also give an arbitrary complex JSON object. One can also create a new config path, if one specifies the root of the new path. e.g. one could pass

```
-conf-override '.modules.cpu_resource_model:{"hyperthreading": false}'
```

to create a configuration for the module `cpu_resource_model`.

Note

One should not specify competing overrides, this means, defining different overrides, which specify the same full path. For example two or more of the following:

```
--conf-override '.modules.static_network_model.latency:50000'
--conf-override '.modules:{}'
--conf-override '.modules.static_network_model: {"latency": 50000}'
--conf-override '.:{modules: {"static_network_model", {"latency": 50000}}}'
```

Depending on which one chooses, one could end up with different problems. The rules for which override takes precedence are fairly complicated and might change in the future. Thus, they are undefined. The first and the fourth in the example are doing completely different things. The first overrides only the value of the path `.modules.static_network_model.latency`, but the fourth replaces the complete configuration with being `.modules.static_network_model.latency` the only path.

1.2 How to Create a New Module?

For the creation of a new module, please refer to [Create your own module](#).

1.3 FAQ

1.3.1 Current Assumptions / Restrictions

- The target system is fixed and the topology of the target system is assumed to be grid topology.
- A fixed initial mapping of application processes from the input trace to a fixed description of the target system is assumed (topology manager).

1.4 Contact

Website: https://tu-dresden.de/zih/haec_sim

1.5 Funding

This work is supported by the German Research Foundation (DFG) in the Collaborative Research Center 912 "Highly Adaptive Energy-Efficient Computing" (HAEC)

Chapter 2

Create your own module

2.1 Basics

Each piece of a trace file has to proceed at chain of modules during the simulation. These pieces are divided into two different types:

- Definitions,
- events.

Definitions are used to store the state of the traced program. This can be the structure of the system, MPI communicators, functions of the traced program, e.g.

The events are recurring notifications during the trace of the program which marks a change in the runtime environment like MPI communications or enter and leave of functions.

For more details, please refer to [Open Trace Format 2 C++ binding](#).

The module `haec_sim::module::source` will always be the head of the module chain, the module `haec_sim::module::sink` will always be the tail of the chain. Besides those two module, the order of the other modules is user defined and could be different for each simulation.

Remarks

One should never rely on a certain order of modules!

Chapter 3

Open Trace Format 2 C++ binding

3.1 Definitions

Where are several definitions in OTF2. Yet not all definitions are accessible in otf2xx.

Currently available are the following:

- [otf2::definition::attribute](#)
- [otf2::definition::clock_properties](#)
- [otf2::definition::comm](#)
- [otf2::definition::group](#)
- [otf2::definition::location](#)
- [otf2::definition::location_group](#)
- [otf2::definition::metric_class](#)
- [otf2::definition::metric_instance](#)
- [otf2::definition::metric_member](#)
- [otf2::definition::parameter](#)
- [otf2::definition::region](#)
- [otf2::definition::string](#)
- [otf2::definition::system_tree_node](#)

For convenience there is a container class similar to a std::map:

- [otf2::definition::container](#)

3.2 Events

Where are several events in OTF2. Yet not all events are accessible in otf2xx.

Currently available are the following:

- [otf2::event::buffer_flush](#)

- `otf2::event::enter`
- `otf2::event::leave`
- `otf2::event::measurement`
- `otf2::event::metric`
- `otf2::event::mpi_collective_begin`
- `otf2::event::mpi_collective_end`
- `otf2::event::mpi_send`
- `otf2::event::mpi_receive`
- `otf2::event::mpi_isend`
- `otf2::event::mpi_isend_complete`
- `otf2::event::mpi_irceive`
- `otf2::event::mpi_irceive_request`
- `otf2::event::mpi_request_cancelled`
- `otf2::event::mpi_request_test`
- `otf2::event::parameter_int`
- `otf2::event::parameter_unsigned_int`
- `otf2::event::parameter_string`
- `otf2::event::thread_acquire_lock`
- `otf2::event::thread_fork`
- `otf2::event::thread_join`
- `otf2::event::thread_release_lock`
- `otf2::event::thread_task_complete`
- `otf2::event::thread_task_create`
- `otf2::event::thread_task_switch`
- `otf2::event::thread_team_begin`
- `otf2::event::thread_team_end`

A buffer for events used to read ahead some information for `mpi_irceive_request`.

- `otf2::event::buffer`

3.3 Timestamp handling

For time we have got some basic ideas. First, we have time points, which are specific points on a timeline. We have durations, which are the distance between two time points. And we have a clock, which gives us a point of reference on the timeline - called epoch - and a precision.

- `otf2::chrono::clock`
- `otf2::chrono::time_point`
- `otf2::chrono::duration`
- `otf2::chrono::ticks`

Chapter 6

Class Index

6.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

nitro::log::detail::actual_stream< bool, Record, Formatter, Sink, Filter, Severity >	65
nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter >	65
nitro::log::detail::actual_stream< false, Record, Formatter, Sink, Filter, Severity >	66
otf2::detail::add_attribute< Type >	66
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::attribute >	67
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::comm >	67
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::Double >	67
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::Float >	68
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::int16 >	68
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::int32 >	68
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::int64 >	69
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::int8 >	69
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::location >	70
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::metric >	70
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::parameter >	70
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::region >	71
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::string >	71
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::uint16 >	72
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::uint32 >	72
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::uint64 >	72
otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::uint8 >	73
nitro::log::filter::and_filter< F1, F2 >	73
otf2::writer::archive	74
nitro::log::detail::assign_severity< bool, Record, Attributes >	77
nitro::log::detail::assign_severity< false, Record, Attributes...>	77
otf2::definition::attribute	
Class for representing a attribute definition	78
otf2::definition::detail::attribute_Impl	79
otf2::attribute_list	80
haec_sim::module::base	
Base class for modules	81
otf2::event::base< Event >	
CRTP base class for all events	91
haec_sim::resource_manager::base< Client >	92
otf2::definition::detail::base< Def, Impl >	
CRTP base class for definition references	94
otf2::common::both< timing, property >	96

otf2::event::buffer	This class isn't an event, but a buffer for events	97
otf2::event::buffer_flush		104
otf2::event::detail::buffer_node		104
otf2::reader::callback	Base class for otf2 reader callbacks	107
otf2::chrono::clock	Simulated clock	114
otf2::definition::clock_properties	Class for representing a clock properties definition	115
otf2::definition::comm	Class for representing a comm definition	116
otf2::definition::detail::comm_impl		118
otf2::definition::comp< Definition >		120
haec_sim::config::config		120
otf2::definition::container< Definition >		121
otf2::definition::container< otf2::definition::property< Definition > >		122
otf2::chrono::convert	Class to convert between ticks and time points	124
haec_sim::config::detail::convert_helper< T >		125
haec_sim::config::detail::convert_helper< bool >		125
haec_sim::config::detail::convert_helper< double >		126

otf2::traits::definition_impl_type< otf2::definition::string >		134
otf2::traits::definition_impl_type< otf2::definition::system_tree_node >		135
haec_sim::topology::depth_first_manager		135
nitro::dl::dl	Class for dynamically loading libraries	136
haec_sim::resource_manager::packet_component::end_process_type		136
otf2::event::enter		137
haec_sim::environment	A class to provide information about the environment of the run	138
otf2::exception		139
nitro::dl::exception		139
haec_sim::exception		140
otf2::writer::global		140
otf2::definition::group< MemberType, GroupType >	Class template for representing groups	142
otf2::definition::detail::group_base		145

otf2::definition::detail::group_impl< MemberType, GroupType >	145
haec_sim::log::detail::haec_log_formater< Record >	147
nitro::log::detail::has_attribute< Attributes >	148
nitro::log::detail::has_attribute< Attribute, Record< Attributes...> >	148
otf2::traits::identity< Type >	
Identity type trait	148
haec_sim::resource_manager::info	149
otf2::traits::is_definition< Type >	149
otf2::traits::is_definition< otf2::definition::attribute >	150
otf2::traits::is_definition< otf2::definition::comm >	150
otf2::traits::is_definition< otf2::definition::group< T, GroupType > >	150
otf2::traits::is_definition< otf2::definition::location >	151
otf2::traits::is_definition< otf2::definition::location_group >	151
otf2::traits::is_definition< otf2::definition::metric_class >	151
otf2::traits::is_definition< otf2::definition::metric_instance >	152
otf2::traits::is_definition< otf2::definition::metric_member >	152
otf2::traits::is_definition< otf2::definition::parameter >	152
otf2::traits::is_definition< otf2::definition::property< Definition > >	153
otf2::traits::is_definition< otf2::definition::region >	153
otf2::traits::is_definition< otf2::definition::string >	153
otf2::traits::is_definition< otf2::definition::system_tree_node >	154
otf2::traits::is_event< Type >	154
otf2::traits::is_event< otf2::event::enter >	154
otf2::traits::is_event< otf2::event::leave >	155
haec_sim::resource_manager::packet_component::is_manager_type	155
nitro::meta::is_variadic_member< U, Attributes >	
Meta function to check if a variadic type pack contains a given type	155
nitro::meta::is_variadic_member< U >	
Meta function to check if a variadic type pack contains a given type	156
nitro::meta::is_variadic_member< U, first, Attributes...>	
Meta function to check if a variadic type pack contains a given type	156
otf2::event::leave	
The class representing a leave event	157
haec_sim::resource_manager::link	158
otf2::writer::local	159
haec_sim::mapping::location	
Class to map from locations to simulation ranks	161
otf2::definition::location	
Class for representing location definitions	161
otf2::definition::location_group	
Class for representing a location group definition	163
otf2::definition::detail::location_group_Impl	165
otf2::definition::detail::location_Impl	166
nitro::log::logger< Record, Formater, Sink, Filter >	167
haec_sim::mapping::detail::lsr_mapping	168
otf2::detail::make_exception< Arg, Args >	169
otf2::detail::make_exception< Arg >	169
haec_sim::topology::manager	
Abstract base class for simulator topology managers. This class places processes on cores on specific boards	170
haec_sim::topology::mapping_file_manager	170
haec_sim::topology::mapping_file_parser	171
otf2::event::measurement	172
nitro::log::message_attribute	172
otf2::event::metric	173
otf2::definition::detail::metric_base	
Dummy class to have metric instances and metric classes in the same id space	174

otf2::definition::metric_class	Class for representing metric class definitions	174
otf2::definition::detail::metric_class_impl	176
otf2::definition::metric_instance	Class for representing metric instance definitions	178
otf2::definition::detail::metric_instance_impl	181
otf2::definition::metric_member	Class representing a metric member definition	183
otf2::definition::detail::metric_member_impl	185
otf2::event::mpi_collective_begin	The class representing the <code>mpi_collective_begin</code> event	187
otf2::event::mpi_collective_end	188
otf2::event::mpi_ireceive	189
otf2::event::mpi_ireceive_request	190
otf2::event::mpi_isend	191
otf2::event::mpi_isend_complete	192
nitro::log::filter::mpi_master_filter< Record >	193
nitro::log::mpi_rank_attribute	193
otf2::event::mpi_receive	194
otf2::event::mpi_request_cancelled	194
otf2::event::mpi_request_test	195
otf2::event::mpi_send	196
haec_sim::resource_manager::packet_component::name_type	197
haec_sim::module::no_zero_durations	{ A module, which ensures that there are no functions with a duration of zero }	197
nitro::log::filter::not_filter< F1 >	198
nitro::log::filter::not_filter< not_filter< F1 > >	199
nitro::log::sink::null	199
nitro::log::filter::null_filter< Record >	199
nitro::log::detail::null_stream	200
nitro::log::omp_thread_id_attribute	200
nitro::log::filter::or_filter< F1, F2 >	201
haec_sim::resource_manager::packet< Components >	201
otf2::definition::parameter	Class for representing parameter definitions	202
otf2::definition::detail::parameter_impl	203
otf2::event::parameter_int	The class representing a <code>parameter_int</code> event	204
otf2::event::parameter_string	206
otf2::event::parameter_unsigned_int	206
nitro::log::pid_attribute	207
algebra::polynomial< T >	207
haec_sim::topology::position	208
haec_sim::resource_manager::packet_component::position_type	209
haec_sim::resource_manager::process_pool	210
otf2::definition::property< Definition >	Class for representing property definitions	211
otf2::definition::detail::property_impl< Definition >	212
nitro::log::pthread_id_attribute	213
haec_sim::resource_manager::packet_component::rank_type	214
otf2::reader::reader	Class for reading in trace files	214
nitro::log::record< Attributes >	223
otf2::reference< Type >	Reference number for definitions	223
otf2::reference_generator< RefType >	Gives a free reference number for a set of definitions	225
otf2::traits::reference_param_type< T >	226

otf2::traits::reference_param_type< definition::group< T, Type > >	226
otf2::traits::reference_param_type< definition::metric_class >	226
otf2::traits::reference_param_type< definition::metric_instance >	227
otf2::traits::reference_type< Type >	227
otf2::traits::reference_type< definition::attribute >	227
otf2::traits::reference_type< definition::comm >	228
otf2::traits::reference_type< definition::detail::group_base >	228
otf2::traits::reference_type< definition::detail::metric_base >	229
otf2::traits::reference_type< definition::group< Def, Type > >	229
otf2::traits::reference_type< definition::location >	229
otf2::traits::reference_type< definition::location_group >	230
otf2::traits::reference_type< definition::metric_class >	230
otf2::traits::reference_type< definition::metric_instance >	231
otf2::traits::reference_type< definition::metric_member >	231
otf2::traits::reference_type< definition::parameter >	231
otf2::traits::reference_type< definition::property< Definition > >	232
otf2::traits::reference_type< definition::region >	232
otf2::traits::reference_type< definition::string >	232
otf2::traits::reference_type< definition::system_tree_node >	233
otf2::definition::region	
Class for represenng a region definition	233
otf2::definition::detail::region_impl	236
haec_sim::resource_manager::detail::serialize_helper< Args >	237
haec_sim::resource_manager::detail::serialize_helper< Packet, Archive >	238
haec_sim::resource_manager::detail::serialize_helper< Packet, Archive, Arg, Args...>	238
nitro::log::detail::set_severity< Attributes >	238
nitro::log::detail::set_severity< record< Attributes...> >	239
nitro::log::severity_attribute	239
nitro::log::filter::severity_filter< Record, N >	240
haec_sim::mapping::simulation_rank	
Class to map from simulation ranks to locations	240
haec_sim::module::sink	
The sink class	241
nitro::log::detail::smart_stream< Record, Formatter, Sink, Filter, Severity >	256
haec_sim::module::source	
This first module in the chain of modules processing trace files	256
nitro::log::std_thread_id_attribute	258
nitro::log::sink::stdout	258
nitro::log::sink::stdout_mt	259
otf2::definition::string	
The string definiton class	259
otf2::definition::detail::string_Impl	260
nitro::dl::symbol< T >	
Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way	261
nitro::dl::symbol< Ret(Args...)>	
Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way	262
otf2::definition::system_tree_node	
Class for representing system tree node definitions	262
otf2::definition::detail::system_tree_node_Impl	264
haec_sim::resource_manager::packet_component::tag_type< N >	265
otf2::event::thread_acquire_lock	266
otf2::event::thread_fork	267
otf2::event::thread_join	267
otf2::event::thread_release_lock	268
otf2::event::thread_task_complete	269
otf2::event::thread_task_create	269
otf2::event::thread_task_switch	270
otf2::event::thread_team_begin	271

otf2::event::thread_team_end	272
otf2::chrono::ticks Representing ticks in a typesafe manner	272
haec_sim::resource_manager::packet_component::time_duration_type	273
time_point Typedef of the time point	274
haec_sim::resource_manager::packet_component::time_range_type	274
nitro::log::timestamp_attribute	274
haec_sim::resource_manager::packet_component::timestamp_type	275
haec_sim::topology::topology Layout of positions in a 3D-Mesh	275
haec_sim::trace_file Abstraction of traces	280
otf2::event::unknown	281
otf2::definition::unknown Class for representing an unknown definition	281
otf2::event::metric::value_container	282
haec_sim::resource_manager::packet_component::value_type< T >	282

Chapter 7

File Index

7.1 File List

Here is a list of all files with brief descriptions:

/home/tilsche/vc/haec-sim/include/algebra/algebra.hpp	285
/home/tilsche/vc/haec-sim/include/algebra/fwd.hpp	285
/home/tilsche/vc/haec-sim/include/algebra/polynomial.hpp	290
/home/tilsche/vc/haec-sim/include/algebra/util.hpp	291
/home/tilsche/vc/haec-sim/include/haec_sim/environment.hpp	292
/home/tilsche/vc/haec-sim/include/haec_sim/exception.hpp	292
/home/tilsche/vc/haec-sim/include/haec_sim/mappings.hpp	294
/home/tilsche/vc/haec-sim/include/haec_sim/config/config.hpp	291
/home/tilsche/vc/haec-sim/include/haec_sim/doc/main.hpp	291
/home/tilsche/vc/haec-sim/include/haec_sim/log/log.hpp	293
/home/tilsche/vc/haec-sim/include/haec_sim/module/base.hpp Contains the class base	295
/home/tilsche/vc/haec-sim/include/haec_sim/module/no_zero_durations.hpp { A module, which ensures that there are no functions with a duration of zero }	296
/home/tilsche/vc/haec-sim/include/haec_sim/module/sink.hpp	297
/home/tilsche/vc/haec-sim/include/haec_sim/module/source.hpp	297
/home/tilsche/vc/haec-sim/include/haec_sim/path/data_transfer_hop.hpp	298
/home/tilsche/vc/haec-sim/include/haec_sim/path/data_transfer_path.hpp	298
/home/tilsche/vc/haec-sim/include/haec_sim/resource_manager/base.hpp	295

Chapter 8

Namespace Documentation

8.1 algebra Namespace Reference

Classes

- class [polynomial](#)

Functions

- template<typename T >
boost::numeric::ublas::vector< T > [get_pow_vec](#) (std::size_t N, T x)

8.1.1 Function Documentation

8.1.1.1 template<typename T > boost::numeric::ublas::vector<T> [algebra::get_pow_vec](#) (std::size_t N, T x)

8.2 boost Namespace Reference

Namespaces

- [serialization](#)

8.3 boost::serialization Namespace Reference

Functions

- template<class Archive >
void [save](#) (Archive &ar, const [otf2::chrono::duration](#) &dur, const unsigned int)
- template<class Archive >
void [load](#) (Archive &ar, [otf2::chrono::duration](#) &dur, const unsigned int)
- template<class Archive >
void [serialize](#) (Archive &ar, [otf2::chrono::duration](#) &dur, const unsigned int file_version)
- template<class Archive >
void [save](#) (Archive &ar, const [otf2::chrono::time_point](#) &tp, const unsigned int)
- template<class Archive >
void [load](#) (Archive &ar, [otf2::chrono::time_point](#) &tp, const unsigned int)
- template<class Archive >
void [serialize](#) (Archive &ar, [otf2::chrono::time_point](#) &tp, const unsigned int file_version)

8.3.1 Function Documentation

- 8.3.1.1 template<class Archive > void boost::serialization::load (Archive & ar, otf2::chrono::time_point & tp, const unsigned int) [inline]
- 8.3.1.2 template<class Archive > void boost::serialization::load (Archive & ar, otf2::chrono::duration & dur, const unsigned int) [inline]
- 8.3.1.3 template<class Archive > void boost::serialization::save (Archive & ar, const otf2::chrono::time_point & tp, const unsigned int) [inline]
- 8.3.1.4 template<class Archive > void boost::serialization::save (Archive & ar, const otf2::chrono::duration & dur, const unsigned int) [inline]
- 8.3.1.5 template<class Archive > void boost::serialization::serialize (Archive & ar, otf2::chrono::time_point & tp, const unsigned int file_version) [inline]
- 8.3.1.6 template<class Archive > void boost::serialization::serialize (Archive & ar, otf2::chrono::duration & dur, const unsigned int file_version) [inline]

8.4 haec_sim Namespace Reference

Namespaces

- config
- log
- mapping
- module
- path
- resource_manager
- topology

Classes

- class environment

A class to provide information about the environment of the run.
- struct exception
- class trace_file

an abstraction of traces

Functions

- template<typename... Args>
void make_exception (Args...args)

8.4.1 Function Documentation

- 8.4.1.1 template<typename... Args> void haec_sim::make_exception (Args... args) [inline]

8.5 haec_sim::config Namespace Reference

Namespaces

- [detail](#)

Classes

- class [config](#)

8.6 haec_sim::config::detail Namespace Reference

Classes

- class [convert_helper](#)
- class [convert_helper< bool >](#)
- class [convert_helper< double >](#)
- class [convert_helper< float >](#)
- class [convert_helper< int >](#)
- class [convert_helper< int64_t >](#)
- class [convert_helper< std::string >](#)
- class [convert_helper< uint64_t >](#)
- class [convert_helper< unsigned int >](#)

8.7 haec_sim::log Namespace Reference

Namespaces

- [detail](#)

TypeDefs

- [typedef nitro::log::logger< detail::record, detail::haec_log_formater, nitro::log::sink::stdout_mt, detail::haec_log_filter > logging](#)

Functions

- void [set_min_severity_level](#) ([nitro::log::severity_level](#) sev)

8.7.1 Typedef Documentation

8.7.1.1 [typedef nitro::log::logger<detail::record, detail::haec_log_formater, nitro::log::sink::stdout_mt, detail::haec_log_filter> haec_sim::log::logging](#)

8.7.2 Function Documentation

8.7.2.1 [void haec_sim::log::set_min_severity_level \(nitro::log::severity_level sev \) \[inline\]](#)

8.8 haec_sim::log::detail Namespace Reference

Classes

- class [haec_log_formater](#)

Typedefs

- `typedef nitro::log::record< nitro::log::message_attribute, nitro::log::timestamp_attribute, nitro::log::severity_attribute, nitro::log::mpi_rank_attribute > record`
- `template<typename Record> using haec_log_filter = nitro::log::filter::severity_filter< Record >`

8.8.1 Typedef Documentation

- 8.8.1.1 `template<typename Record> using haec_sim::log::detail::haec_log_filter = typedef nitro::log::filter::severity_filter<Record>`
- 8.8.1.2 `typedef nitro::log::record<nitro::log::message_attribute, nitro::log::timestamp_attribute, nitro::log::severity_attribute, nitro::log::mpi_rank_attribute> haec_sim::log::detail::record`

8.9 haec_sim::mapping Namespace Reference

Namespaces

- `detail`

Classes

- class `location`
class to map from locations to simulation ranks
- class `simulation_rank`
class to map from simulation ranks to locations

Functions

- `detail::lsr_mapping & lsr_mapping()`

8.9.1 Function Documentation

- 8.9.1.1 `detail::lsr_mapping & haec_sim::mapping::lsr_mapping() [inline]`

8.10 haec_sim::mapping::detail Namespace Reference

Classes

- class `lsr_mapping`

8.11 haec_sim::module Namespace Reference

Classes

- class `base`
Base class for modules.
- class `no_zero_durations`
{ A module, which ensures that there are no functions with a duration of zero }

- class [sink](#)
The sink class.
- class [source](#)
This first module in the chain of modules processing trace files.

8.12 haec_sim::path Namespace Reference

Classes

- class [data_transfer_hop](#)
- class [data_transfer_path](#)

Functions

- [data_transfer_hop wireless_data_transfer_hop \(\)](#)
returns a [data_transfer_hop](#) with values for wireless connections
- [data_transfer_hop optical_data_transfer_hop \(\)](#)
returns a [data_transfer_hop](#) with values for optical connections

8.12.1 Function Documentation

8.12.1.1 [data_transfer_hop haec_sim::path::optical_data_transfer_hop\(\)](#) [inline]

returns a [data_transfer_hop](#) with values for optical connections

8.12.1.2 [data_transfer_hop haec_sim::path::wireless_data_transfer_hop\(\)](#) [inline]

returns a [data_transfer_hop](#) with values for wireless connections

8.13 haec_sim::resource_manager Namespace Reference

Namespaces

- [detail](#)
- [packet_component](#)

Classes

- class [base](#)
- struct [info](#)
- class [link](#)
- class [packet](#)
- class [process_pool](#)

Enumerations

- enum [type { type::shutdown, type::cpu, type::metric_collector, type::energy }](#)

8.13.1 Enumeration Type Documentation

8.13.1.1 enum `haec_sim::resource_manager::type` [strong]

Enumerator

- shutdown*
- cpu*
- metric_collector*
- energy*

8.14 haec_sim::resource_manager::detail Namespace Reference

Classes

- class `serialize_helper`
- class `serialize_helper< Packet, Archive >`
- class `serialize_helper< Packet, Archive, Arg, Args...>`

8.15 haec_sim::resource_manager::packet_component Namespace Reference

Classes

- struct `end_process_type`
- struct `is_manager_type`
- struct `name_type`
- struct `position_type`
- struct `rank_type`
- struct `tag_type`
- struct `time_duration_type`
- struct `time_range_type`
- struct `timestamp_type`
- struct `value_type`

TypeDefs

- using `response_tag = tag_type< 101 >`
- using `request_tag = tag_type< 100 >`

8.15.1 Typedef Documentation

8.15.1.1 using `haec_sim::resource_manager::packet_component::request_tag = typedef tag_type<100>`

8.15.1.2 using `haec_sim::resource_manager::packet_component::response_tag = typedef tag_type<101>`

8.16 haec_sim::topology Namespace Reference

Classes

- class `depth_first_manager`
- class `manager`

Abstract base class for simulator topology managers. This class places processes on cores on specific boards.

- class [mapping_file_manager](#)
- class [mapping_file_parser](#)
- class [position](#)
- class [topology](#)

The topology class represents the layout of positions in a 3D-Mesh.

Functions

- std::istream & [operator>>](#) (std::istream &s, [position](#) &pos)
- std::ostream & [operator<<](#) (std::ostream &s, const [position](#) &pos)
- bool [operator<](#) (const [position](#) &a, const [position](#) &b)
- bool [operator==](#) (const [position](#) &a, const [position](#) &b)
- bool [operator!=](#) (const [position](#) &a, const [position](#) &b)

8.16.1 Function Documentation

8.16.1.1 bool [haec_sim::topology::operator!=](#) (const [position](#) & a, const [position](#) & b) [inline]

8.16.1.2 bool [haec_sim::topology::operator<](#) (const [position](#) & a, const [position](#) & b) [inline]

8.16.1.3 std::ostream& [haec_sim::topology::operator<<](#) (std::ostream & s, const [position](#) & pos) [inline]

8.16.1.4 bool [haec_sim::topology::operator==](#) (const [position](#) & a, const [position](#) & b) [inline]

8.16.1.5 std::istream & [haec_sim::topology::operator>>](#) (std::istream & s, [position](#) & pos) [inline]

8.17 nitro Namespace Reference

Namespaces

- [dl](#)
- [log](#)
- [meta](#)

8.18 nitro::dl Namespace Reference

Classes

- class [dl](#)

Class for dynamically loading libraries.
- class [exception](#)
- class [symbol](#)

Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way.
- class [symbol< Ret\(Args...\)>](#)

Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way.

8.19 nitro::log Namespace Reference

Namespaces

- [detail](#)
- [filter](#)
- [sink](#)

Classes

- struct [actual_stream](#)
- class [logger](#)
- class [message_attribute](#)
- class [mpi_rank_attribute](#)
- class [omp_thread_id_attribute](#)
- class [pid_attribute](#)
- class [pthread_id_attribute](#)
- class [record](#)
- class [severity_attribute](#)
- class [std_thread_id_attribute](#)
- class [timestamp_attribute](#)

Enumerations

- enum [severity_level](#) : char {
 [severity_level::trace](#), [severity_level::debug](#), [severity_level::info](#), [severity_level::warn](#),
 [severity_level::error](#), [severity_level::fatal](#) }

Functions

- template<typename S >
 S & [operator<<](#) (S &s, [severity_level](#) sev)

8.19.1 Enumeration Type Documentation

8.19.1.1 enum nitro::log::severity_level : char [strong]

Enumerator

trace
debug
info
warn
error
fatal

8.19.2 Function Documentation

8.19.2.1 template<typename S> S& nitro::log::operator<<(S & s, severity_level sev)

8.20 nitro::log::detail Namespace Reference

Classes

- struct `actual_stream`
- struct `actual_stream< false, Record, Formatter, Sink, Filter, Severity >`
- struct `assign_severity`
- struct `assign_severity< false, Record, Attributes...>`
- struct `has_attribute`
- struct `has_attribute< Attribute, Record< Attributes...> >`
- class `null_stream`
- struct `set_severity`
- struct `set_severity< record< Attributes...> >`
- class `smart_stream`

Functions

- template<typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter, typename T, severity_level Severity>
`smart_stream< Record, Formatter, Sink, Filter, Severity > operator<< (smart_stream< Record, Formatter, Sink, Filter, Severity > &&s, const T &t)`
- template<typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter, typename T, severity_level Severity>
`smart_stream< Record, Formatter, Sink, Filter, Severity > & operator<< (smart_stream< Record, Formatter, Sink, Filter, Severity > &s, const T &t)`
- template<typename T>
`null_stream operator<< (null_stream &&s, const T &t)`

8.20.1 Function Documentation

8.20.1.1 template<typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter, typename T, severity_level Severity>
`smart_stream<Record, Formatter, Sink, Filter, Severity> nitro::log::detail::operator<<(smart_stream<Record, Formatter, Sink, Filter, Severity > && s, const T &t)`

8.20.1.2 template<typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter, typename T, severity_level Severity>
`smart_stream<Record, Formatter, Sink, Filter, Severity>& nitro::log::detail::operator<<(smart_stream<Record, Formatter, Sink, Filter, Severity > & s, const T &t)`

8.20.1.3 template<typename T>
`null_stream nitro::log::detail::operator<<(null_stream &&s, const T &t)`

8.21 nitro::log::filter Namespace Reference

Classes

- class `and_filter`
- class `mpi_master_filter`
- class `not_filter`
- class `not_filter< not_filter< F1 > >`
- class `null_filter`
- class `or_filter`
- class `severity_filter`

8.22 nitro::log::sink Namespace Reference

Classes

- class [null](#)
- class [stdout](#)
- class [stdout_mt](#)

8.23 nitro::meta Namespace Reference

Classes

- struct [is_variadic_member](#)
meta function to check if a variadic type pack contains a given type.
- struct [is_variadic_member< U >](#)
meta function to check if a variadic type pack contains a given type.
- struct [is_variadic_member< U, first, Attributes...>](#)
meta function to check if a variadic type pack contains a given type.

8.24 otf2 Namespace Reference

Namespaces

- [chrono](#)
- [common](#)
- [definition](#)
- [detail](#)
- [event](#)
- [reader](#)
- [traits](#)
- [writer](#)

Classes

- class [attribute_list](#)
- struct [exception](#)
- class [reference](#)
represents a reference number for definitions
- class [reference_generator](#)
gives a free reference number for a set of definitions

Functions

- template<typename... Args>
`void make_exception (Args...args)`
- template<typename... Args>
`void check (OTF2_ErrorCode code, Args...args)`

8.24.1 Function Documentation

- 8.24.1.1 template<typename... Args> void otf2::check (OTF2_ErrorCode code, Args... args) [inline]
- 8.24.1.2 template<typename... Args> void otf2::make_exception (Args... args) [inline]

8.25 otf2::chrono Namespace Reference

Classes

- struct [clock](#)
simulated clock
- class [convert](#)
class to convert between ticks and time points
- class [ticks](#)
representing ticks in a typesafe manner

TypeDefs

- typedef std::chrono::duration< int64_t, std::ratio< 1, 1000000000000 > > [picoseconds](#)
typedef for duration of lenght picosecond
- typedef std::chrono::nanoseconds [nanoseconds](#)
typedef for duration of lenght nanosecond
- typedef std::chrono::microseconds [microseconds](#)
typedef for duration of lenght microseconds
- typedef std::chrono::milliseconds [milliseconds](#)
typedef for duration of lenght milliseconds
- typedef std::chrono::seconds [seconds](#)
typedef for duration of lenght seconds
- typedef std::chrono::minutes [minutes](#)
typedef for duration of lenght minutes
- typedef std::chrono::hours [hours](#)
typedef for duration of lenght hours
- typedef [picoseconds duration](#)
otf2::chrono::duration defaults to picoseconds
- typedef [clock::time_point time_point](#)

Functions

- template<typename Clock , typename Duration >
[otf2::chrono::time_point convert_time_point](#) (std::chrono::time_point< Clock, Duration > tp)
converts from std::chrono::timepoint to otf2::chrono::time_point
- template<typename FromDuration , typename ToDuration = otf2::chrono::duration>
[constexpr ToDuration duration_cast](#) (const FromDuration &dtn)
convert between durations
- std::ostream & [operator<<](#) (std::ostream &s, [time_point](#) tp)
- [time_point armageddon \(\)](#)
returns latest representable time_point
- [time_point genesis \(\)](#)
returns the first representable time_point

8.25.1 Typedef Documentation

8.25.1.1 `typedef picoseconds otf2::chrono::duration`

`otf2::chrono::duration` defaults to picoseconds

8.25.1.2 `typedef std::chrono::hours otf2::chrono::hours`

typedef for duration of lenght hours

8.25.1.3 `typedef std::chrono::microseconds otf2::chrono::microseconds`

typedef for duration of lenght microseconds

8.25.1.4 `typedef std::chrono::milliseconds otf2::chrono::milliseconds`

typedef for duration of lenght milliseconds

8.25.1.5 `typedef std::chrono::minutes otf2::chrono::minutes`

typedef for duration of lenght minutes

8.25.1.6 `typedef std::chrono::nanoseconds otf2::chrono::nanoseconds`

typedef for duration of lenght nanosecond

8.25.1.7 `typedef std::chrono::duration<int64_t, std::ratio<1,1000000000000> > otf2::chrono::picoseconds`

typedef for duration of lenght picosecond

8.25.1.8 `typedef std::chrono::seconds otf2::chrono::seconds`

typedef for duration of lenght seconds

8.25.1.9 `typedef clock::time_point otf2::chrono::time_point`

8.25.2 Function Documentation

8.25.2.1 `time_point otf2::chrono::armageddon() [inline]`

returns latest representable `time_point`

Note

I'm not Nostradamus nor I'm predicting an armageddon to be at this `time_point`. Additionally, as the epoch isn't defined for `otf2::chrono::clock`, there isn't a reliable way to determine this timepoint anyways.

8.25.2.2 `template<typename Clock , typename Duration > otf2::chrono::time_point otf2::chrono::convert_time_point(std::chrono::time_point< Clock, Duration > tp)`

converts from `std::chrono::timepoint` to `otf2::chrono::time_point`

Parameters

in	<i>tp</i>	the <code>std::chrono</code> time point
----	-----------	---

Returns

the same time point as `otf2::chrono::time_point`

8.25.2.3 `template<typename FromDuration , typename ToDuration = otf2::chrono::duration> constexpr ToDuration
otf2::chrono::duration_cast (const FromDuration & dtn)`

convert between durations

This ain't a simple cast, it also takes different prefixes into account. e.g. `duration_cast<seconds>milliseconds(1000) == seconds(1)`

But this could also mean, that there is information loss. e.g. `duration_cast<seconds>milliseconds(1300) == seconds(1)`

Template Parameters

<i>FromDuration</i>	type of source duration
<i>ToDuration</i>	type of target duration, defaults to

See also

[otf2::chrono::duration](#)

Parameters

in	<i>dtn</i>	duration which is casted
----	------------	--------------------------

Returns

duration to which is casted

8.25.2.4 `time_point otf2::chrono::genesis () [inline]`

returns the first representable `time_point`

8.25.2.5 `std::ostream& otf2::chrono::operator<< (std::ostream & s, time_point tp) [inline]`

8.26.1 Enumeration Type Documentation

8.26.1.1 enum otf2::common::collective_type [strong]

Enumerator

barrier
broadcast
gather
gatherv
scatter
scatterv
all_gather
all_gatherv
all_to_all
all_to_allv
all_to_allw
all_reduce
reduce
reduce_scatter
scan
exscan
reduce_scatter_block
create_handle
destroy_handle
allocate
deallocate
create_handle_and_allocate
destroy_handle_and_deallocate

8.26.1.2 enum otf2::common::event_type [strong]

enum for representing the type of an eventThis is used by the [otf2::event::buffer](#) to distinguish between events, as they are stored as void pointers.

Enumerator

buffer_flush
enter
leave
measurement
metric
mpi_collective_begin
mpi_collective_end
mpi_ireceive
mpi_ireceive_request
mpi_isend
mpi_isend_complete
mpi_receive
mpi_request_cancelled
mpi_request_test
mpi_send
parameter_int
parameter_string
parameter_unsigned_int
thread_acquire_lock
thread_fork
thread_join
thread_release_lock
thread_task_complete
thread_task_create
thread_task_switch
thread_team_begin
thread_team_end

8.26.1.3 enum otf2::common::flags_type [strong]

Enumerator

none
dynamic
phase

8.26.1.4 enum otf2::common::group_flag_type [strong]

Enumerator

none
global_members

8.26.1.5 enum otf2::common::group_type [strong]

an enum for representing the contents of a group definition

Enumerator

- unknown*** a unknown type
- locations*** locations
- regions*** regions (not used)
- metric*** metrics (not used)
- comm_locations***
- comm_group***
- comm_self*** special group, only contains itself

8.26.1.6 enum otf2::common::location_group_type [strong]

Enumerator

- unknown***
- process***

8.26.1.7 enum otf2::common::location_type [strong]

an enum for representing the type of a location

Enumerator

- unknown*** unknown
- cpu_thread*** a cpu thread
- gpu*** on gpu
- metric*** a metric - acts as recorder for metric instances

8.26.1.8 enum otf2::common::metric_base [strong]

Enumerator

- binary***
- decimal***

8.26.1.9 enum otf2::common::metric_mode [strong]

Enumerator

- accumulated_start***
- accumulated_point***
- accumulated_last***
- accumulated_next***
- absolute_point***
- absolute_last***
- absolute_next***
- relative_point***
- relative_last***
- relative_next***

8.26.1.10 enum otf2::common::metric_occurrence [strong]

metric occurrence

Enumerator

strict Metric occurs at every region enter and leave.

sync Metric occurs only at a region enter and leave, but does not need to occur at every enter/leave.

async Metric can occur at any place i.e. it is not related to region enter and leaves.

8.26.1.11 enum otf2::common::metric_scope [strong]

metric scope

Specifies the scope the values of a metric class are valid for

Enumerator

location for a location

location_group for a location group

system_tree_node for a system tree node

group a custom group of locations

8.26.1.12 enum otf2::common::metric_timing [strong]

Enumerator

start

point

last

next

8.26.1.13 enum otf2::common::metric_type [strong]

Enumerator

other

papi

rusage

user

8.26.1.14 enum otf2::common::metric_value_property [strong]

Enumerator

accumulated

absolute

relative

8.26.1.15 enum otf2::common::paradigm_type [strong]

Enumerator

unknown
user
compiler
openmp
mpi
cuda
measurement_system
pthread
hmpp
ompss
hardware
gaspi
upc
shmem

8.26.1.16 enum otf2::common::parameter_type [strong]

Enumerator

string
int64
uint64

8.26.1.17 enum otf2::common::recorder_kind [strong]

Enumerator

unknown
abstract
cpu
gpu

8.26.1.18 enum otf2::common::role_type [strong]

Enumerator

unknown
function
wrapper
loop
code
parallel

parameter

8.27 otf2::definition Namespace Reference

Namespaces

- [detail](#)

Classes

- class [attribute](#)
 class for representing a attribute definition
- class [clock_properties](#)
 class for representing a clock properties definition
- class [comm](#)
 class for representing a comm definition
- struct [comp](#)
- class [container](#)
- class [container< otf2::definition::property< Definition > >](#)
- class [group](#)
 class template for representing groups
- class [location](#)
 class for representing location definitions
- class [location_group](#)
 class for representing a location group definition
- class [metric_class](#)
 class for representing metric class definitions
- class [metric_instance](#)
 class for representing metric instance definitions
- class [metric_member](#)
 class representing a metric member definition
- class [parameter](#)

- class **property**
class for representing parameter definitions
- class **region**
class for representing a region definition
- class **string**
The string definiton class.
- class **system_tree_node**
class for representing system tree node definitions
- class **unknown**
class for representing an unknown definition

TypeDefs

- using **locations_group** = group< otf2::definition::location, otf2::common::group_type::locations >
- using **regions_group** = group< otf2::definition::region, otf2::common::group_type::regions >

Chapter 9

Class Documentation

9.1 nitro::log::detail::actual_stream< bool, Record, Formatter, Sink, Filter, Severity > Struct Template Reference

```
#include <stream.hpp>
```

Public Types

- `typedef smart_stream< Record, Formatter, Sink, Filter, Severity > type`

9.1.1 Member Typedef Documentation

9.1.1.1 template<bool , typename Record , template< typename > class Formatter, typename Sink , template< typename > class Filter, severity_level Severity> typedef smart_stream<Record, Formatter, Sink, Filter, Severity> nitro::log::detail::actual_stream< bool, Record, Formatter, Sink, Filter, Severity >::type

The documentation for this struct was generated from the following file:

- `/home/tilsche/vc/haec-sim/include/nitro/log/stream.hpp`

9.2 nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter > Struct Template Reference

```
#include <stream.hpp>
```

Public Types

- `typedef Severity::type type`

Public Attributes

- `typedef Record`
- `typedef Formatter`
- `typedef Sink`
- `typedef Filter`

9.2.1 Member Typedef Documentation

9.2.1.1 template<severity_level Severity, typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter> typedef Severity ::type nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter >::type

9.2.2 Member Data Documentation

9.2.2.1 template<severity_level Severity, typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter> typedef nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter >::Filter

9.2.2.2 template<severity_level Severity, typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter> typedef nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter >::Formatter

9.2.2.3 template<severity_level Severity, typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter> typedef nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter >::Record

9.2.2.4 template<severity_level Severity, typename Record, template< typename > class Formatter, typename Sink, template< typename > class Filter> typedef nitro::log::actual_stream< Severity, Record, Formatter, Sink, Filter >::Sink

The documentation for this struct was generated from the following file:

- /home/tolsche/vc/haec-sim/include/nitro/log/[stream.hpp](#)

9.3 nitro::log::detail::actual_stream< false, Record, Formatter, Sink, Filter, Severity > Struct Template Reference

```
#include <stream.hpp>
```

Public Types

- [typedef null_stream type](#)

9.3.1 Member Typedef Documentation

9.3.1.1 template<typename Record , template< typename > class Formatter, typename Sink , template< typename > class Filter, severity_level Severity> typedef null_stream nitro::log::detail::actual_stream< false, Record, Formatter, Sink, Filter, Severity >::type

The documentation for this struct was generated from the following file:

- /home/tolsche/vc/haec-sim/include/nitro/log/[stream.hpp](#)

9.4 otf2::detail::add_attribute< Type > Struct Template Reference

```
#include <attribute_list.hpp>
```

The documentation for this struct was generated from the following file:

- /home/tilsche/vc/haec-sim/include/otf2xx/[attribute_list.hpp](#)

9.5 otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::attribute > Struct Template Reference

```
#include <attribute_list.hpp>
```

Public Member Functions

- void [operator\(\)](#) (OTF2_AttributeList *list, [otf2::definition::attribute](#) attribute, [otf2::definition::attribute](#) value)

9.5.1 Member Function Documentation

9.5.1.1 void otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::attribute >::operator() (OTF2_AttributeList * list, otf2::definition::attribute attribute, otf2::definition::attribute value) [inline]

The documentation for this struct was generated from the following file:

- /home/tilsche/vc/haec-sim/include/otf2xx/[attribute_list.hpp](#)

9.6 otf2::detail::add_attribute< otf2::definition::attribute::attribute_type::comm > Struct Template Reference

9.26 otf2::definition::attribute Class Reference

class for representing a attribute definition

```
#include <attribute.hpp>
```

Inheritance diagram for otf2::definition::attribute:

Public Types

- `typedef impl_type::attribute_type attribute_type`

Public Member Functions

- `attribute (otf2::reference< attribute > ref, otf2::definition::string name, otf2::definition::string description, attribute_type type)`
- `attribute ()=default`
- `otf2::definition::string name () const`
Returns a string definition containing the name.
- `otf2::definition::string description () const`
Returns a string definition containing the name.
- `attribute_type type () const`
Returns the type of the attribute definition.

Additional Inherited Members

9.26.1 Detailed Description

class for representing a attribute definition

9.26.2 Member Typedef Documentation

9.26.2.1 `typedef impl_type::attribute_type otf2::definition::attribute::attribute_type`

9.26.3 Constructor & Destructor Documentation

9.26.3.1 `otf2::definition::attribute (otf2::reference< attribute > ref, otf2::definition::string name, otf2::definition::string description, attribute_type type) [inline]`

9.26.3.2 `otf2::definition::attribute::attribute () [default]`

9.26.4 Member Function Documentation

9.26.4.1 `otf2::definition::string otf2::definition::attribute::description () const [inline]`

Returns a string definition containing the name.

Returns

[otf2::definition::string](#) containing the name

9.26.4.2 [otf2::definition::string otf2::definition::attribute::name\(\) const \[inline\]](#)

Returns a string definition containing the name.

Returns

[otf2::definition::string](#) containing the name

9.26.4.3 [attribute_type otf2::definition::attribute::type\(\) const \[inline\]](#)

Returns the type of the attribute definition.

For possible values see [otf2::common::type](#)

Returns

the type of the attribute definition

9.29.1 Detailed Description

Base class for modules.

9.29.2 Constructor & Destructor Documentation

9.29.2.1 `haec_sim::module::base::base (boost::mpi::communicator comm, haec_sim::topology::topology & t) [inline]`

Creates own constructor.

9.29.2.2 `haec_sim::module::base::~base () [inline], [pure virtual]`

Creates own destructor.

9.29.3 Member Function Documentation

9.29.3.1 `boost::mpi::communicator& haec_sim::module::base::comm () [inline], [protected]`

Returns the MPI communicator.

9.29.3.2 `auto haec_sim::module::base::comm () const -> const boost::mpi::communicator & [inline], [protected]`

9.29.3.3 `virtual void haec_sim::module::base::definition (otf2::definition::attribute definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.4 `virtual void haec_sim::module::base::definition (otf2::definition::comm definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.5 `virtual void haec_sim::module::base::definition (otf2::definition::locations_group definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.6 `virtual void haec_sim::module::base::definition (otf2::definition::regions_group definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#), and [haec_sim::module::sink](#).

9.29.3.7 virtual void haec_sim::module::base::definition (otf2::definition::comm_locations_group *definition*) [inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#), and [haec_sim::module::sink](#).

9.29.3.8 virtual void haec_sim::module::base::definition (otf2::definition::comm_group *definition*) [inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.9 virtual void haec_sim::module::base::definition (otf2::definition::comm_self_group *definition*) [inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.10 virtual void haec_sim::module::base::definition (otf2::definition::location *definition*) [inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#), and [haec_sim::module::source](#).

9.29.3.11 virtual void haec_sim::module::base::definition (otf2::definition::location_group *definition*) [inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.12 virtual void haec_sim::module::base::definition (otf2::definition::parameter *definition*) [inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.13 virtual void haec_sim::module::base::definition (**otf2::definition::region definition**) [inline],
[override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.14 virtual void haec_sim::module::base::definition (**otf2::definition::string definition**) [inline],
[override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.15 virtual void haec_sim::module::base::definition (**otf2::definition::system_tree_node definition**)
[inline], [override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.16 virtual void haec_sim::module::base::definition (**otf2::definition::clock_properties definition**) [inline],
[override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.17 virtual void haec_sim::module::base::definition (**otf2::definition::metric_class definition**) [inline],
[override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.18 virtual void haec_sim::module::base::definition (**otf2::definition::metric_member definition**) [inline],
[override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.19 virtual void haec_sim::module::base::definition (**otf2::definition::metric_instance definition**) [inline],
[override], [virtual]

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.20 `virtual void haec_sim::module::base::definition(otf2::definition::location_property definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.21 `virtual void haec_sim::module::base::definition(otf2::definition::location_group_property definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.22 `virtual void haec_sim::module::base::definition(otf2::definition::system_tree_node_property definition) [inline], [override], [virtual]`

Copyhandler for global definition.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.23 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::buffer_flush & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.24 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::enter & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#), and [haec_sim::module::no_zero_durations](#).

9.29.3.25 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::leave & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#), and [haec_sim::module::no_zero_durations](#).

9.29.3.26 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::measurement & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.27 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::metric & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.28 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::mpi_send & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.29 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::mpi_receive & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.30 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::mpi_isend_request & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.31 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::mpi_isend_complete & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.32 `virtual void haec_sim::module::base::event (otf2::definition::location location, const otf2::event::mpi_ireceive_complete & evnt) [inline], [override], [virtual]`

Copyhandler for given event.

otf2::event::thread_fork & evnt ) [inline], [override], [virtual]
```

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

```
9.29.3.42 virtual void haec_sim::module::base::event ( otf2::definition::location location, const  
otf2::event::thread_join & evnt ) [inline], [override], [virtual]
```

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

```
9.29.3.43 virtual void haec_sim::module::base::event ( otf2::definition::location location, const  
otf2::event::thread_team_begin & evnt ) [inline], [override], [virtual]
```

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

```
9.29.3.44 virtual void haec_sim::module::base::event ( otf2::definition::location location, const  
otf2::event::thread_team_end & evnt ) [inline], [override], [virtual]
```

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

```
9.29.3.45 virtual void haec_sim::module::base::event ( otf2::definition::location location, const  
otf2::event::thread_acquire_lock & evnt ) [inline], [override], [virtual]
```

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.46 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::thread_release_lock & evt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.47 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::thread_task_create & evt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.48 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::thread_task_switch & evt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.49 `virtual void haec_sim::module::base::event(otf2::definition::location location, const otf2::event::thread_task_complete & evt) [inline], [override], [virtual]`

Copyhandler for given event.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.50 `virtual void haec_sim::module::base::events_done(const otf2::reader::reader & rdr) [inline], [override], [virtual]`

Method will be called after the [otf::reader::reader](#) has finished reading all events and definition records in the trace file.

Reimplemented from [otf2::reader::callback](#).

Reimplemented in [haec_sim::module::sink](#).

9.29.3.51 `bool haec_sim::module::base::has_next() const [inline]`

Returns true if there is a next module.

9.29.3.52 `bool haec_sim::module::base::is_master() const [inline], [protected]`

Returns true if the current process is the master process (=0).

9.29.3.53 `haec_sim::module::base* const haec_sim::module::base::next() [inline]`

Returns the pointer to the next module.

9.29.3.54 `virtual otf2::chrono::time_point haec_sim::module::base::recalculate_time(otf2::definition::location location, otf2::chrono::time_point tp) [inline], [protected], [virtual]`

Recalculates new time point.

9.29.3.55 `void haec_sim::module::base::set_next(haec_sim::module::base * next) [inline]`

Sets pointer to next module.

9.29.3.56 `void haec_sim::module::base::set_next(haec_sim::module::base & next) [inline]`

Sets pointer to next module.

9.29.3.57 `auto haec_sim::module::base::topology() -> haec_sim::topology::topology& [inline], [protected]`

9.29.3.58 `auto haec_sim::module::base::topology() const -> const haec_sim::topology::topology& [inline], [protected]`

The documentation for this class was generated from the following file:

- /home/tlsche/vc/haec-sim/include/haec_sim/module/[base.hpp](#)

9.30 otf2::event::base< Event > Class Template Reference

CRTP base class for all events.

```
#include <base.hpp>
```

Public Member Functions

- `base ()=default`
- `base (otf2::chrono::time_point timestamp)`

9.32.1 Detailed Description

`template<typename Def, typename Impl> class otf2::definition::detail::base< Def, Impl >`

CRTP base class for definition references.

This class is used to implement some common methods, constructors and member for the definition record reference types.

This class is implemented using CRTP.

This class holds the `shared_ptr` and some common methods.

Template Parameters

<i>Def</i>	type of definition record reference type
<i>Impl</i>	type of definition record implementation type

9.32.2 Member Typedef Documentation

9.32.2.1 `template<typename Def, typename Impl> typedef otf2::reference<typename otf2::traits<::reference_param_type<Def>::type> otf2::definition::detail::base< Def, Impl >::reference_type`

9.32.3 Constructor & Destructor Documentation

9.32.3.1 `template<typename Def, typename Impl> otf2::definition::detail::base< Def, Impl >::base (std::shared_ptr<Impl> data) [inline]`

9.32.3.2 `template<typename Def, typename Impl> otf2::definition::detail::base< Def, Impl >::base () [default]`

9.32.3.3 `template<typename Def, typename Impl> otf2::definition::detail::base< Def, Impl >::base (const base<Def, Impl > & other) [default]`

9.32.3.4 `template<typename Def, typename Impl> otf2::definition::detail::base< Def, Impl >::base (base<Def, Impl > && other) [default]`

9.32.4 Member Function Documentation

9.32.4.1 `template<typename Def, typename Impl> std::shared_ptr<Impl> otf2::definition::detail::base< Def, Impl >::get () const [inline]`

Returns the internal pointer.

Warning

{ This method isn't part of the public interface of definition objects. You're discouraged to rely on it. }

Returns

`std::shared_ptr<Impl>` to the referenced object

9.32.4.2 `template<typename Def, typename Impl> bool otf2::definition::detail::base< Def, Impl >::is_valid () const [inline]`

Returns if the definition object is valid.

Warning

{ If this returns false, it's not allowed to call any other functions on this object }

For now, a definition is valid, if the internal pointer isn't set to nullptr.

Returns

true or false

9.32.4.3 template<typename Def, typename Impl> base& otf2::definition::detail::base<Def, Impl>::operator=(const base<Def, Impl> &) [default]

9.32.4.4 template<typename Def, typename Impl> base& otf2::definition::detail::base<Def, Impl>::operator=(base<Def, Impl> &&) [default]

9.32.4.5 template<typename Def, typename Impl> reference_type otf2::definition::detail::base<Def, Impl>::ref() const [inline]

Returns the reference number of the definition.

This number is used by libotf2 to identify a definition record.

Returns

a reference number

9.32.4.6 template<typename Def, typename Impl> static Def otf2::definition::detail::base<Def, Impl>::undefined() [inline], [static]

Returns a reference to an undefined definition.

In most cases undefined means, that the [ref\(\)](#) of this definition is -1.

Returns

a definiton object

9.32.5 Member Data Documentation

9.34.3.48 virtual void otf2::event::buffer::event( otf2::definition::location loc, const otf2::event::thread_release_lock & event ) [inline], [override], [virtual]
```

Reimplemented from [otf2::reader::callback](#).

```
9.34.3.49 virtual void otf2::event::buffer::event( otf2::definition::location loc, const otf2::event::thread_task_create & event ) [inline], [override], [virtual]
```

Reimplemented from [otf2::reader::callback](#).

```
9.34.3.50 virtual void otf2::event::buffer::event( otf2::definition::location loc, const otf2::event::thread_task_switch & event ) [inline], [override], [virtual]
```

Reimplemented from [otf2::reader::callback](#).

```
9.34.3.51 virtual void otf2::event::buffer::event( otf2::definition::location loc, const otf2::event::thread_task_complete & event ) [inline], [override], [virtual]
```

Reimplemented from [otf2::reader::callback](#).

```
9.34.3.52 virtual void otf2::event::buffer::events_done( const otf2::reader::reader & ) [inline], [override], [virtual]
```

events done callback

This callback gets called after the [otf2::reader::reader](#) finished reading all events and definitions in the trace file.

Reimplemented from [otf2::reader::callback](#).

```
9.34.3.53 void otf2::event::buffer::process_data( ) [inline]
```

9.37.1 Detailed Description

base class for `otf2` reader callbacks.

Inherit from this class, but be careful! If you override one function, all other member functions names will be hidden by your override.

Fix this by inserting the following two lines in your class:

```
using otf2::reader::callback::event; using otf2::reader::callback::definition;
```

Make sure to adopt to your base class if your class inherit indirectly from this class.

Tip: Add the keyword `override` to your methodes you intent to override. This will prevent you from accidentally defining a methode with a different signature.

9.37.2 Constructor & Destructor Documentation

9.37.2.1 `otf2::reader::callback::~callback()` [inline], [pure virtual]

9.37.3 Member Function Documentation

9.37.3.1 `virtual void otf2::reader::callback::definition(otf2::definition::attribute)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.2 `virtual void otf2::reader::callback::definition(otf2::definition::comm)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.3 `virtual void otf2::reader::callback::definition(otf2::definition::locations_group)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.4 `virtual void otf2::reader::callback::definition(otf2::definition::regions_group)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [haec_sim::module::sink](#), [otf2::event::buffer](#), [otf2::event::buffer](#), [haec_sim::module::base](#), and [haec_sim::module::base](#).

9.37.3.5 `virtual void otf2::reader::callback::definition(otf2::definition::comm_locations_group)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [haec_sim::module::sink](#), [otf2::event::buffer](#), [otf2::event::buffer](#), [haec_sim::module::base](#), and [haec_sim::module::base](#).

9.37.3.6 `virtual void otf2::reader::callback::definition(otf2::definition::comm_group)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.7 `virtual void otf2::reader::callback::definition(otf2::definition::comm_self_group)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.8 `virtual void otf2::reader::callback::definition(otf2::definition::location)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), [haec_sim::module::base](#), and [haec_sim::module::source](#).

9.37.3.9 `virtual void otf2::reader::callback::definition(otf2::definition::location_group)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.10 `virtual void otf2::reader::callback::definition(otf2::definition::parameter)` [inline], [virtual]

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.11 `virtual void otf2::reader::callback::definition(otf2::definition::region) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.12 `virtual void otf2::reader::callback::definition(otf2::definition::string) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.13 `virtual void otf2::reader::callback::definition(otf2::definition::system_tree_node) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.14 `virtual void otf2::reader::callback::definition(otf2::definition::clock_properties) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.15 `virtual void otf2::reader::callback::definition(otf2::definition::metric_class) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.16 `virtual void otf2::reader::callback::definition(otf2::definition::metric_member) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.17 `virtual void otf2::reader::callback::definition(otf2::definition::metric_instance) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.18 `virtual void otf2::reader::callback::definition(otf2::definition::location_property) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.19 `virtual void otf2::reader::callback::definition(otf2::definition::location_group_property) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.20 `virtual void otf2::reader::callback::definition(otf2::definition::system_tree_node_property) [inline], [virtual]`

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

9.37.3.21 `virtual void otf2::reader::callback::definition(otf2::definition::unknown) [inline], [virtual]`

Reimplemented in [haec_sim::module::source](#).

9.37.3.22 virtual void otf2::reader::callback::definitions_done (const otf2::reader::reader &) [inline], [virtual]

definitions done callback

This callback gets called after the otf::reader::reader has finished reading all definition records

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::source](#).

9.37.3.23 virtual void otf2::reader::callback::event (otf2::definition::location , const otf2::event::buffer_flush &) [inline], [virtual]

Reimplemented in [otf2::event::buffer](#), [haec_sim::module::base](#), and [haec_sim::module::sink](#).

9.37.3.24 virtual void otf2::reader::callback::event (otf2::definition::location , const otf2::event::enter &) [inline], [virtual]

Reimplemented in [otf2::event::buffer](#), [haec_sim::module::base](#), [haec_sim::module::sink](#), and [haec_sim::module::no_zero_durations](#).

9.37.3.25 virtual void otf2::reader::callback::event (otf2::definition::location , const otf2::event::leave &) [inline], [virtual]

Reimplemented in [otf2::event::buffer](#), [haec_sim::module::base](#), [haec_sim::module::sink](#), and [haec_sim::module::no_zero_durations](#).

9.37.3.26 virtual void otf2::reader::callback::event (otf2::definition::location , const otf2::event::measurement &) [inline], [virtual]

Reimplemented in [otf2::event::buffer](#), [haec_sim::module::base](#), and [haec_sim::module::sink](#).

9.37.3.27 virtual void otf2::reader::callback::event (otf2::definition::location , const otf2::event::metric &) [inline], [virtual]

Reimplemented in [otf2::event::buffer](#), [haec_sim::module::sink](#), and [haec_sim::module::base](#).

9.37.3.28 virtual void otf2::reader::callback::event (otf2::definition::location , const otf2::event::mpi_send &) [inline], [virtual]

Reimplemented in [haec_sim::module::source](#).

9.37.3.51 virtual void otf2::reader::callback::events_done(const otf2::reader::reader &) [inline], [virtual]

events done callback

This callback gets called after the otf::reader::reader finished reading all events and definitions in the trace file.

Reimplemented in [haec_sim::module::sink](#), [otf2::event::buffer](#), and [haec_sim::module::base](#).

The documentation for this class was generated from the following file:

- /home/tolsche/vc/haec-sim/include/otf2xx/reader/callback.hpp

9.38 otf2::chrono::clock Struct Reference

simulated clock

```
#include <clock.hpp>
```

Public Types

- [typedef otf2::chrono::duration duration](#)
typedef for durations of the clock
- [typedef duration::rep rep](#)
- [typedef duration::period period](#)
- [typedef std::chrono::time_point<clock> time_point](#)
typedef for time points of the clock

Static Public Attributes

- static const bool [is_steady](#) = true
This clock is steady.

9.38.1 Detailed Description

simulated clock

This clock is only for time points used in the simulator. It has by intent no now() method.

9.38.2 Member Typedef Documentation

9.38.2.1 [typedef otf2::chrono::duration otf2::chrono::clock::duration](#)

typedef for durations of the clock

See also

[otf2::chrono::duration](#)

9.38.2.2 [typedef duration::period otf2::chrono::clock::period](#)

9.38.2.3 [typedef duration::rep otf2::chrono::clock::rep](#)

9.38.2.4 [typedef std::chrono::time_point<clock> otf2::chrono::clock::time_point](#)

typedef for time points of the clock

See also

[otf2::chrono::time_point](#)

9.38.3 Member Data Documentation

9.38.3.1 const bool otf2::chrono::clock::is_steady = true [static]

This clock is steady.

The documentation for this struct was generated from the following file:

- /home/tlscche/vc/haec-sim/include/otf2xx/chrono/[clock.hpp](#)

9.39 otf2::definition::clock_properties Class Reference

class for representing a clock properties definition

```
#include <clock_properties.hpp>
```

Public Member Functions

- [clock_properties \(otf2::chrono::ticks ticks_ticks_per_second, otf2::chrono::ticks start_time, otf2::chrono::ticks length\)](#)
- [clock_properties \(\)](#)
- [otf2::chrono::ticks ticks_per_second \(\) const](#)
returns the number of ticks per second
- [otf2::chrono::ticks start_time \(\) const](#)
returns the global start offset
- [otf2::chrono::ticks length \(\) const](#)
returns the length of the trace file

9.39.1 Detailed Description

class for representing a clock properties definition

9.39.2 Constructor & Destructor Documentation

9.39.2.1 [otf2::definition::clock_properties::clock_properties \(otf2::chrono::ticks ticks_ticks_per_second, otf2::chrono::ticks start_time, otf2::chrono::ticks length \) \[inline\]](#)

9.39.2.2 [otf2::definition::clock_properties::clock_properties \(\) \[inline\]](#)

9.39.3 Member Function Documentation

9.39.3.1 [otf2::chrono::ticks otf2::definition::clock_properties::length \(\) const \[inline\]](#)

returns the length of the trace file

This is the number of ticks between the first and the last timestamp found in the trace.

Returns

length of the trace

9.39.3.2 otf2::chrono::ticks otf2::definition::clock_properties::start_time () const [inline]

returns the global start offset

This is the number of ticks since the epoch for the first timestamp which is found in the trace

Returns

global offset

9.39.3.3 otf2::chrono::ticks otf2::definition::clock_properties::ticks_per_second () const [inline]

returns the number of ticks per second

Returns

ticks per second

The documentation for this class was generated from the following file:

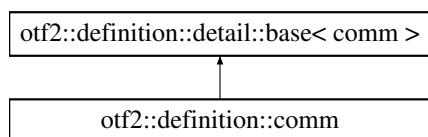

- /home/tilsche/vc/haec-sim/include/otf2xx/definition/clock_properties.hpp

9.40 otf2::definition::comm Class Reference

class for representing a comm definition

```
#include <comm.hpp>
```

Inheritance diagram for otf2::definition::comm:

Public Member Functions

- [comm \(reference< comm > ref, otf2::definition::string name, otf2::definition::comm_group group, otf2::definition::comm parent\)](#)
- [comm \(reference< comm > ref, otf2::definition::string name, otf2::definition::comm_group group\)](#)
- [comm \(reference< comm > ref, otf2::definition::string name, otf2::definition::comm_self_group group, comm parent\)](#)
- [comm \(reference< comm > ref, otf2::definition::string name, otf2::definition::comm_self_group group\)](#)
- [comm \(\)=default](#)
- [otf2::definition::string name \(\) const](#)
returns the name of the comm definition as a string definition
- [otf2::definition::comm_group group \(\) const](#)
returns the comm group of this comm
- [otf2::definition::comm_self_group self_group \(\) const](#)
returns the comm self group of this comm
- [bool has_self_group \(\) const](#)
returns if there is a comm self group If return is true, then it has got a comm self group Otherwise it has got a comm group

- bool `has_parent () const`
returns the comm has got a parent
- `otf2::definition::comm parent () const`
returns the parent of this comm

Additional Inherited Members

9.40.1 Detailed Description

class for representing a comm definition

9.40.2 Constructor & Destructor Documentation

9.40.2.1 `otf2::definition::comm::comm (reference< comm > ref, otf2::definition::string name, otf2::definition::comm_group group, otf2::definition::comm parent) [inline]`

9.40.2.2 `otf2::definition::comm::comm (reference< comm > ref, otf2::definition::string name, otf2::definition::comm_group group) [inline]`

9.40.2.3 `otf2::definition::comm::comm (reference< comm > ref, otf2::definition::string name, otf2::definition::comm_self_group group, comm parent) [inline]`

9.40.2.4 `otf2::definition::comm::comm (reference< comm > ref, otf2::definition::string name, otf2::definition::comm_self_group group) [inline]`

9.40.2.5 `otf2::definition::comm::comm () [default]`

9.40.3 Member Function Documentation

9.40.3.1 `otf2::definition::comm_group otf2::definition::comm::group () const [inline]`

returns the comm group of this comm

Returns

a comm group

Attention

before call, check that there is a comm group

Exceptions

<code>otf::exception</code>	if thee is no comm group
-----------------------------	--------------------------

9.40.3.2 `bool otf2::definition::comm::has_parent () const [inline]`

returns the comm has got a parent

Returns

bool

9.40.3.3 `bool otf2::definition::comm::has_self_group() const [inline]`

returns if there is a comm self group If return is true, then it has got a comm self group Otherwise it has got a comm group

Returns

`bool`

9.40.3.4 `otf2::definition::string otf2::definition::comm::name() const [inline]`

returns the name of the comm definion as a string definition

Returns

a string definiton containing the name

9.40.3.5 `otf2::definition::comm otf2::definition::comm::parent() const [inline]`

returns the parent of this comm

Returns

returns a `otf::definition::comm`, which might not be valid, if the comm hasn't got a parent!

9.40.3.6 `otf2::definition::comm_self_group otf2::definition::comm::self_group() const [inline]`

returns the comm self group of this comm

Returns

a comm self group

Attention

before call, check that there is a comm self group

Exceptions

<code>otf::exception</code>	if thee is no comm self group
-----------------------------	-------------------------------

converts from ticks to time point
- [otf2::chrono::ticks operator\(\) \(time_point t\) const](#)
converts from time points to ticks

9.46.1 Detailed Description

class to convert between ticks and time points

This class can convert between ticks and time points. For this, it needs the number of ticks per second.

Note

The time epoch is assumed to be equal between the time point and time point represented with the number ticks given.

9.46.2 Constructor & Destructor Documentation

9.46.2.1 otf2::chrono::convert(uint64_t ticks_per_second) [inline]

Parameters

in	<i>ticks_per_<→> second</i>	Number of ticks per second
----	-----------------------------------	----------------------------

9.46.2.2 otf2::chrono::convert::convert(otf2::chrono::ticks ticks) [inline]

Parameters

in	ticks	Number of ticks per second
----	-------	----------------------------

9.46.3 Member Function Documentation**9.46.3.1 otf2::chrono::time_point otf2::chrono::convert::operator() (otf2::chrono::ticks ticks) const [inline]**

converts from ticks to time point

Parameters

in	ticks	ticks since epoch
----	-------	-------------------

Returns

[time_point](#) with a duration equal to the passed time since the epoch.

9.46.3.2 otf2::chrono::ticks otf2::chrono::convert::operator() (time_point t) const [inline]

converts from time points to ticks

Parameters

in	t	a time point
----	---	--------------

Returns

number ticks equal to passed time of the duration of the time point

9.73 nitro::dl::dl Class Reference

Class for dynamically loading libraries.

```
#include <dl.hpp>
```

Public Member Functions

- `dl (const std::string &filename)`
`construct with the name of the library`
- `template<typename T>`
`nitro::dl::symbol< T > load (const std::string &name)`
- `std::shared_ptr< void > get () const`

9.73.1 Detailed Description

Class for dynamically loading libraries.

This class uses libdl to load libraries dynamically.

9.73.2 Constructor & Destructor Documentation

9.73.2.1 nitro::dl::dl (const std::string & *filename*) [inline]

construct with the name of the library

Parameters

in	<i>filename</i>	the filename of the library { libdl tries to find a library with the given name in LD_LIBRARY_PATH. }
----	-----------------	---

Exceptions

<i>nitro::dl::exception</i>	{ throws if the library could not be opened. }
-----------------------------	--

9.73.3 Member Function Documentation

9.73.3.1 std::shared_ptr<void> nitro::dl::dl::get () const [inline]

9.76 haec_sim::environment Class Reference

A class to provide information about the environment of the run.

```
#include <environment.hpp>
```

Static Public Member Functions

- static std::string [get_variable](#) (std::string name)
returns the given ENV variables
- static const [trace_file & input_trace](#) (std::string file="")
returns trace_file object for input trace
- static const [trace_file & output_trace](#) (std::string dir="", std::string file="")
returns trace_file object for output trace
- static const std::string & [positions_map_path](#) (std::string path="")
returns the path to the positions.map file
- static const std::string & [conf_path](#) (std::string path="")
returns the path to the haec_sim.conf file

9.76.1 Detailed Description

A class to provide information about the environment of the run.

Gives information about the output directory of the trace, input trace, ENV variables etc.

9.76.2 Member Function Documentation

9.76.2.1 static const std::string& haec_sim::environment::conf_path (std::string path = " ") [inline], [static]

returns the path to the haec_sim.conf file

9.76.2.2 static std::string haec_sim::environment::get_variable (std::string name) [inline], [static]

returns the given ENV variables

Returns the value of the given environment variable. Returns an empty string, if the variable isn't set.

9.76.2.3 static const trace_file& haec_sim::environment::input_trace (std::string file = " ") [inline], [static]

returns [trace_file](#) object for input trace

9.76.2.4 static const trace_file& haec_sim::environment::output_trace (std::string dir = " ", std::string file = " ") [inline], [static]

returns [trace_file](#) object for output trace

9.76.2.5 static const std::string& haec_sim::environment::positions_map_path (std::string path = " ") [inline], [static]

returns the path to the positions.map file

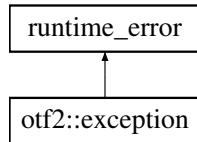

The documentation for this class was generated from the following file:

- /home/tolsche/vc/haec-sim/include/haec_sim/[environment.hpp](#)

9.81 otf2::definition::group< MemberType, GroupType > Class Template Reference

class template for representing groups

```
#include <fwd.hpp>
```

Inheritance diagram for otf2::definition::group< MemberType, GroupType >:

Public Types

- `typedef impl_type::group_type group_type`
- `typedef impl_type::group_flag_type group_flag_type`
- `typedef impl_type::paradigm_type paradigm_type`
- `typedef impl_type::value_type value_type`

Public Member Functions

- `group(otf2::reference< detail::group_base > ref, otf2::definition::string name, paradigm_type paradigm, group_flag_type group_flag)`
- `group()=default`
- `otf2::definition::string name() const`
returns the name of the group definition as a string definition
- `group_type type() const`
returns the type of the group definition
- `paradigm_type paradigm() const`
returns the paradigm of the group definition
- `group_flag_type group_flag() const`
returns the group flag of the group definition
- `std::vector< std::uint64_t > members() const`
returns the member of the group definition
- `std::size_t size() const`

- returns the number of members*
- `value_type operator[] (std::size_t i) const`
returns the i-th member in the group
- `void add_member (value_type member)`
adds a definition to the group

Additional Inherited Members

9.81.1 Detailed Description

`template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>class otf2::definition::group< MemberType, GroupType >`

class template for representing groups

9.81.2 Member Typedef Documentation

9.81.2.1 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> typedef impl_type::group_flag_type otf2::definition::group< MemberType, GroupType >::group_flag_type`

9.81.2.2 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> typedef impl_type::group_type otf2::definition::group< MemberType, GroupType >::group_type`

9.81.2.3 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> typedef impl_type::paradigm_type otf2::definition::group< MemberType, GroupType >::paradigm_type`

9.81.2.4 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> typedef impl_type::value_type otf2::definition::group< MemberType, GroupType >::value_type`

9.81.3 Constructor & Destructor Documentation

9.81.3.1 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> otf2::definition::group< MemberType, GroupType >::group (otf2::reference< detail::group_base > ref, otf2::definition::string name, paradigm_type paradigm, group_flag_type group_flag) [inline]`

9.81.3.2 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> otf2::definition::group< MemberType, GroupType >::group () [default]`

9.81.4 Member Function Documentation

9.81.4.1 `template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown> void otf2::definition::group< MemberType, GroupType >::add_member (value_type member) [inline]`

adds a definition to the group

9.81.4.2 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
group_flag_type otf2::definition::group< MemberType, GroupType >::group_flag () const [inline]

returns the group flag of the group definition

See also

[otf2::common::group_flag_type](#)

9.81.4.3 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
std::vector<std::uint64_t> otf2::definition::group< MemberType, GroupType >::members () const [inline]

returns the member of the group definition

Returns

std::vector containing reference numbers of definitions

9.81.4.4 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
otf2::definition::string otf2::definition::group< MemberType, GroupType >::name () const [inline]

returns the name of the group definition as a string definition

Returns

a string definition containing the name

9.81.4.5 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
value_type otf2::definition::group< MemberType, GroupType >::operator[] (std::size_t i) const [inline]

returns the i-th member in the group

If my_group.members() returns {1,5,19}, then my_group[1] will return the definition with reference number 5.

Returns

the i-th definition in the group

9.81.4.6 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
paradigm_type otf2::definition::group< MemberType, GroupType >::paradigm () const [inline]

returns the paradigm of the group definition

See also

[otf2::common::paradigm_type](#)

9.81.4.7 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
std::size_t otf2::definition::group< MemberType, GroupType >::size () const [inline]

returns the number of members

Returns

number of member as std::size_t

9.81.4.8 template<class MemberType, otf2::common::group_type GroupType = otf2::common::group_type::unknown>
group_type otf2::definition::group< MemberType, GroupType >::type () const [inline]

returns the type of the group definion

See also

9.109.2.1 template<typename U , typename first , typename... Attributes> const bool nitro::meta::is_variadic_member< U, first, Attributes...>::value = std::is_same<U, first>::value || is_variadic_member<U, Attributes...>::value [static]
```

value contains true if input type is contained in the pack

The documentation for this struct was generated from the following file:

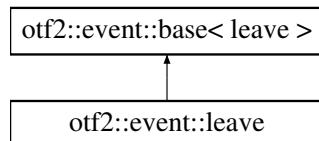

- /home/tilsche/vc/haec-sim/include/nitro/meta/variadic.hpp

9.110 otf2::event::leave Class Reference

The class representing a leave event.

```
#include <leave.hpp>
```

Inheritance diagram for otf2::event::leave:

Public Member Functions

- [leave \(otf2::definition::region region, otf2::chrono::time_point timestamp\)](#)
standard constructor
- [leave \(const otf2::event::leave &other, otf2::chrono::time_point timestamp\)](#)
special copy constructor, takes an other event and a new timestamp
- [otf2::definition::region region \(\) const](#)
returns the region, which was entered

9.110.1 Detailed Description

The class representing a leave event.

9.110.2 Constructor & Destructor Documentation

```
9.110.2.1 otf2::event::leave ( otf2::definition::region region, otf2::chrono::time_point timestamp ) [inline]
```

standard constructor

Parameters

<i>region</i>	the region, which was entered
<i>timestamp</i>	the timestamp, when the event has happen

9.110.2.2 `otf2::event::leave::leave (const otf2::event::leave & other, otf2::chrono::time_point timestamp) [inline]`

special copy constructor, takes an other event and a new timestamp

Parameters

<i>other</i>	the other event, which should be copied
<i>timestamp</i>	the new timestamp

9.110.3 Member Function Documentation

9.110.3.1 `otf2::definition::region otf2::event::leave::region () const [inline]`

returns the region, which was entered

Returns

9.114 otf2::definition::location Class Reference

class for representing location definitions

```
#include <location.hpp>
```

Inheritance diagram for otf2::definition::location:

Public Types

- `typedef impl_type::location_type location_type`

Public Member Functions

- `location (otf2::reference< otf2::definition::location > ref, otf2::definition::string name, otf2::definition::location_group lg, location_type type, std::uint64_t events=0)`
- `location (const otf2::definition::location &other, std::uint64_t events)`
- `location ()=default`
- `otf2::definition::string name () const`
returns the name of the location definition as a string definition
- `otf2::definition::location_group location_group () const`
returns the location group of the location definition
- `location_type type () const`
returns the type of the location definition
- `std::uint64_t num_events () const`
returns the number of events for this location. Use with care. If you read in this location and write it to another trace, you have to make sure, that you have also written all the events. Otherwise you should make a copy, like haec_sim::module::sink.

- `iterator end () const`

Additional Inherited Members

9.129.1 Detailed Description

class for representing metric class definitions

A metric class is a collection of metric members.

If you don't have a referencing metric instance, then the scope and recorder of this metric is implicitly given by the location, where the referencing metric event occurs.

9.129.2 Member Typedef Documentation

9.129.2.1 `typedef impl_type::iterator otf2::definition::metric_class::iterator`

9.129.2.2 `typedef impl_type::metric_occurrence otf2::definition::metric_class::metric_occurrence`

9.129.2.3 `typedef impl_type::recorder_kind_type otf2::definition::metric_class::recorder_kind_type`

9.129.3 Constructor & Destructor Documentation

9.129.3.1 `otf2::definition::metric_class::metric_class (reference< detail::metric_base > ref, metric_occurrence occurrence, recorder_kind_type recorder_kind) [inline]`

9.129.3.2 `otf2::definition::metric_class::metric_class () [default]`

9.129.4 Member Function Documentation

9.129.4.1 `void otf2::definition::metric_class::add_member (otf2::definition::metric_member member) [inline]`

add a metric member to this metric class

9.129.4.2 `iterator otf2::definition::metric_class::begin () const [inline]`

9.129.4.3 `iterator otf2::definition::metric_class::end () const [inline]`

9.129.4.4 `metric_occurrence otf2::definition::metric_class::occurrence () const [inline]`

the occurrence of this metric class

See also

[otf2::common::metric_occurrence](#)

9.129.4.5 `otf2::definition::metric_member otf2::definition::metric_class::operator[] (std::size_t i) const [inline]`

returns the i-th metric member

9.129.4.6 `recorder_kind_type otf2::definition::metric_class::recorder_kind () const [inline]`

returns the recorder kind of the metric class

See also

[otf2::common::recorder_kind](#)

9.129.4.7 `std::size_t otf2::definition::metric_class::size () const [inline]`

returns the number of metric members

The documentation for this class was generated from the following file:

9.131.3.4 `otf2::definition::metric_instance::metric_instance (reference< detail::metric_base > ref, otf2::definition::metric_class metric_class, otf2::definition::location recorder, otf2::definition::locations_group scope) [inline]`

9.131.3.5 `otf2::definition::metric_instance::metric_instance () [default]`

9.131.4 Member Function Documentation

9.131.4.1 `otf2::definition::locations_group otf2::definition::metric_instance::group_scope () const [inline]`

returns the scope

This returns the scope as group of locations definition.

Note

It might not be a valid definition

See also

[scope\(\)](#)

9.131.4.2 otf2::definition::location_group otf2::definition::metric_instance::location_group_scope () const [inline]

returns the scope

This returns the scope as location group definition.

Note

It might not be a valid definition

See also

[scope\(\)](#)

9.131.4.3 otf2::definition::location otf2::definition::metric_instance::location_scope () const [inline]

returns the scope

This returns the scope as location definition.

Note

It might not be a valid definition

See also

[scope\(\)](#)

9.131.4.4 otf2::definition::metric_class otf2::definition::metric_instance::metric_class () const [inline]

returns the referenced metric class

9.131.4.5 metric_occurrence otf2::definition::metric_instance::occurrence () const [inline]

the occurrence of this metric class

See also

[otf2::common::metric_occurrence](#)

9.131.4.6 otf2::definition::location otf2::definition::metric_instance::recorder () const [inline]

returns the recorder

The recorder is the location, where this metric was recorded

9.131.4.7 metric_scope otf2::definition::metric_instance::scope() const [inline]

returns the scope type of this metric

This tells if the values are valid for a location, a location group, a system tree node or a custom group of locations.

See also

[otf2::common::metric_scope](#)

9.131.4.8 otf2::definition::system_tree_node otf2::definition::metric_instance::system_tree_node_scope() const [inline]

returns the scope

This returns the scope as system tree node definition.

Note

It might not be a valid definition

See also

[scope\(\)](#)

9.133 otf2::definition::metric_member Class Reference

class representing a metric member definition

```
#include <metric_member.hpp>
```

Inheritance diagram for otf2::definition::metric_member:

Public Types

- `typedef impl_type::metric_type metric_type`
- `typedef impl_type::metric_mode metric_mode`
- `typedef impl_type::value_type_type value_type_type`
- `typedef impl_type::value_base_type value_base_type`
- `typedef impl_type::value_exponent_type value_exponent_type`

Public Member Functions

- `metric_member (reference< metric_member > ref, otf2::definition::string name, otf2::definition::string description, metric_type type, metric_mode mode, value_type_type value_type, value_base_type value_base, value_exponent_type value_exponent, otf2::definition::string value_unit)`
- `metric_member ()=default`
- `otf2::definition::string name() const`
returns the name of the metric member

- `otf2::definition::string description () const`
returns the description of the metric member
- `metric_type type () const`
returns the type of the metric member
- `metric_mode mode () const`
returns the mode of the metric member
- `value_type_type value_type () const`
returns the type of the value of the metric member
- `value_base_type value_base () const`
returns the base to scale the values with
- `value_exponent_type value_exponent () const`
returns the exponent to scale the values with
- `otf2::definition::string value_unit () const`
returns the unit of the values without prefixes

Additional Inherited Members

9.133.1 Detailed Description

class representing a metric member definition

A metric member defines one "channel" of an metric. It defines the value type, name etc.

9.133.2 Member Typedef Documentation

- 9.133.2.1 `typedef impl_type::metric_mode otf2::definition::metric_member::metric_mode`
- 9.133.2.2 `typedef impl_type::metric_type otf2::definition::metric_member::metric_type`
- 9.133.2.3 `typedef impl_type::value_base_type otf2::definition::metric_member::value_base_type`
- 9.133.2.4 `typedef impl_type::value_exponent_type otf2::definition::metric_member::value_exponent_type`
- 9.133.2.5 `typedef impl_type::value_type otf2::definition::metric_member::value_type_type`

9.133.3 Constructor & Destructor Documentation

- 9.133.3.1 `otf2::definition::metric_member::metric_member (reference< metric_member > ref, otf2::definition::string name, otf2::definition::string description, metric_type type, metric_mode mode, value_type_type value_type, value_base_type value_base, value_exponent_type value_exponent, otf2::definition::string value_unit) [inline]`

- 9.133.3.2 `otf2::definition::metric_member::metric_member () [default]`

9.133.4 Member Function Documentation

- 9.133.4.1 `otf2::definition::string otf2::definition::metric_member::description () const [inline]`

returns the description of the metric member

9.133.4.2 **metric_mode** otf2::definition::metric_member::mode() const [inline]

returns the mode of the metric member

See also

[otf2::common::metric_mode](#)

9.133.4.3 **otf2::definition::string** otf2::definition::metric_member::name() const [inline]

returns the name of the metric member

9.133.4.4 **metric_type** otf2::definition::metric_member::type() const [inline]

returns the type of the metric member

See also

[otf2::common::metric_type](#)

9.133.4.5 **value_base_type** otf2::definition::metric_member::value_base() const [inline]

returns the base to scale the values with

Either decimal(10) or binary(2)

See also

[otf2::common::metric_base](#)

9.133.4.6 **value_exponent_type** otf2::definition::metric_member::value_exponent() const [inline]

returns the exponent to scale the values with

9.133.4.7 **value_type_type** otf2::definition::metric_member::value_type() const [inline]

returns the type of the value of the metric member

See also

[otf2::common::type](#)

9.133.4.8 **otf2::definition::string** otf2::definition::metric_member::value_unit() const [inline]

returns the unit of the values without prefixes

The documentation for this class was generated from the following file:

- /home/tilsche/vc/haec-sim/include/otf2xx/definition/[metric_member.hpp](#)

9.134 otf2::definition::detail::metric_member_impl Class Reference

```
#include <metric_member_impl.hpp>
```

Public Types

- `/home/tlsche/vc/haec-sim/include/otf2xx/definition/detail/metric_member_impl.hpp`

9.135 otf2::event::mpi_collective_begin Class Reference

The class representing the `mpi_collective_begin` event.

```
#include <mpi_collective_begin.hpp>
```

Inheritance diagram for otf2::event::mpi_collective_begin:

Public Member Functions

- `mpi_collective_begin (otf2::chrono::time_point timestamp)`
`standard constructor`
- `mpi_collective_begin (const mpi_collective_begin &other, otf2::chrono::time_point timestamp)`

special copy constructor

9.135.1 Detailed Description

The class representing the [mpi_collective_begin](#) event.

9.135.2 Constructor & Destructor Documentation

9.135.2.1 `otf2::event::mpi_collective_begin::mpi_collective_begin (otf2::chrono::time_point timestamp) [inline]`

standard constructor

Parameters

<i>timestamp</i>	the timestamp, when the event has happen
------------------	--

9.135.2.2 `otf2::event::mpi_collective_begin::mpi_collective_begin (const mpi_collective_begin & other, otf2::chrono::time_point timestamp) [inline]`

special copy constructor

Parameters

<i>other</i>	the other event
<i>timestamp</i>	the new timestamp

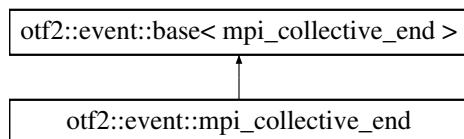

The documentation for this class was generated from the following file:

- /home/tilsche/vc/haec-sim/include/otf2xx/event/[mpi_collective_begin.hpp](#)

9.136 otf2::event::mpi_collective_end Class Reference

9.159 otf2::event::parameter_int Class Reference

The class representing a `parameter_int` event.

```
#include <parameter_int.hpp>
```

Inheritance diagram for otf2::event::parameter_int:

Public Member Functions

- `parameter_int(otf2::chrono::time_point timestamp, otf2::definition::parameter parameter, std::int64_t value)`
default constructor
- `parameter_int(const otf2::event::parameter_int &other, otf2::chrono::time_point timestamp)`

- special copy constructor, taking an other object and a new timestamp*
- `otf2::definition::parameter parameter () const`
returns the corresponding parameter definition
 - `std::int64_t value () const`
returns the value of the definition

9.159.1 Detailed Description

The class representing a [parameter_int](#) event.

9.159.2 Constructor & Destructor Documentation

9.159.2.1 `otf2::event::parameter_int::parameter_int(otf2::chrono::time_point timestamp, otf2::definition::parameter parameter, std::int64_t value) [inline]`

default constructor

Parameters

<i>timestamp</i>	the timestamp, when the event has happen
<i>parameter</i>	the corresponding parameter definition
<i>value</i>	the value of the parameter

9.159.2.2 `otf2::event::parameter_int::parameter_int(const otf2::event::parameter_int & other, otf2::chrono::time_point timestamp) [inline]`

special copy constructor, taking an other object and a new timestamp

Parameters

<i>other</i>	the other object
<i>timestamp</i>	new timestamp

9.159.3 Member Function Documentation

9.159.3.1 `otf2::definition::parameter otf2::event::parameter_int::parameter() const [inline]`

returns the corresponding parameter definition

Returns

the parameter definition

9.159.3.2 `std::int64_t otf2::event::parameter_int::value() const [inline]`

returns the value of the definition

Returns

the value

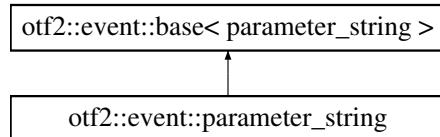

The documentation for this class was generated from the following file:

9.166 haec_sim::resource_manager::process_pool Class Reference

```
#include <process_pool.hpp>
```

Static Public Member Functions

- static void **init** (boost::mpi::communicator *world*, boost::mpi::communicator *workers*)
 { initialize process pool with global communicator and on for workers }
- static void **enter** (boost::mpi::communicator *local*, haec_sim::topology::topology &*t*)
 processes enter this function to wait until needed
- static boost::mpi::communicator **spawn** (haec_sim::resource_manager::type *type*, std::size_t *num_processes*)
 Allocates processes from process pool to be resource managers.
- static void **shutdown** ()
 removes all remaining processes in process pool
- static boost::mpi::communicator & **world_comm** ()
 Contains all workers and all remaining in process pool Valid on workers and processes in the process pool.
- static boost::mpi::communicator & **worker_comm** ()
 Contains all workers.

9.166.1 Member Function Documentation

9.166.1.1 static void haec_sim::resource_manager::process_pool::enter (boost::mpi::communicator *local*, haec_sim::topology::topology &*t*) [inline], [static]

processes enter this function to wait until needed

Parameters

<i>local</i>	the communicator between all idling processes
<i>conf</i>	the configuration for the idling processes

9.166.1.2 static void haec_sim::resource_manager::process_pool::init (boost::mpi::communicator *world*, boost::mpi::communicator *workers*) [inline], [static]

{ initialize process pool with global communicator and on for workers }

9.166.1.3 static void haec_sim::resource_manager::process_pool::shutdown() [inline], [static]

removes all remaining processes in process pool

This is needed to have a clean exit

9.166.1.4 static boost::mpi::communicator haec_sim::resource_manager::process_pool::spawn (haec_sim::resource_manager::type type, std::size_t num_processes) [inline], [static]

Allocates processes from process pool to be resource managers.

This function can only be used for worker processes. This is a collective operation, so all processes have to enter this function

9.166.1.5 static boost::mpi::communicator& haec_sim::resource_manager::process_pool::worker_comm() [inline], [static]

Contains all workers.

Only valid on worker processes

9.166.1.6 static boost::mpi::communicator& haec_sim::resource_manager::process_pool::world_comm() [inline], [static]

Contains all workers and all remaining in process pool Valid on workers and processes in the process pool.

The documentation for this class was generated from the following file:

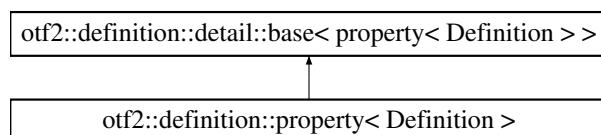

- /home/tilsche/vc/haec-sim/include/haec_sim/resource_manager/process_pool.hpp

9.167 otf2::definition::property< Definition > Class Template Reference

class for representing property definitions

```
#include <fwd.hpp>
```

Inheritance diagram for otf2::definition::property< Definition >:

Public Member Functions

- [property](#) (Definition `def`, string `name`, string `value`)
- [property](#) ()=default
- [otf2::definition::string name](#) () const
returns the name of the property
- [otf2::definition::string value](#) () const
returns the value of the parameter definition
- Definition [def](#) () const
returns the referenced definition record

Additional Inherited Members

9.167.1 Detailed Description

`template<class Definition>class otf2::definition::property< Definition >`

class for representing property definitions

9.167.2 Constructor & Destructor Documentation

9.167.2.1 `template<class Definition> otf2::definition::property< Definition >::property (Definition def, string name, string value) [inline]`

9.167.2.2 `template<class Definition> otf2::definition::property< Definition >::property () [default]`

9.167.3 Member Function Documentation

9.167.3.1 `template<class Definition> Definition otf2::definition::property< Definition >::def () const [inline]`

returns the referenced definition record

9.167.3.2 `template<class Definition> otf2::definition::string otf2::definition::property< Definition >::name () const [inline]`

returns the name of the property

Returns

a `string` definiton containing the name

9.167.3.3 `template<class Definition> otf2::definition::string otf2::definition::property< Definition >::value () const [inline]`

returns the value of the parameter defintion

The documentation for this class was generated from the following files:

9.171 otf2::reader::reader Class Reference

the class for reading in trace files

```
#include <reader.hpp>
```

Public Member Functions

- [reader](#)(const std::string &name)
constructor Triggers initialization done callback
- void [read_definitions](#)()
triggers the read of all definition records

- void `register_location` (`otf2::definition::location` `location`) const
 - tells the reader, that it should read the events of the given location*
- void `read_events` ()
 - triggers the read of all event records*
- `std::uint64_t num_locations` () const
 - returns the number of locations*
- `otf2::reader::callback & callback` ()
 - returns the callback instance*
- bool `has_callback` () const
 - returns true, if a callback was set*
- void `set_callback` (`otf2::reader::callback &callback`, `bool buffered=false`)
 - set the given callback as callback for the reader*
- `reader (reader &)=delete`
- `reader & operator= (reader &)=delete`
- `~reader` ()
 - destructor*
- `map_type< otf2::definition::attribute > & attributes` ()
 - returns all attributes*
- `map_type< otf2::definition::comm > & comms` ()
 - returns all comms*
- `map_type< otf2::definition::location > & locations` ()
 - returns all locations*
- const `map_type< otf2::definition::location > & locations` () const
 - returns all locations in a const context*
- `map_type< otf2::definition::location_group > & location_groups` ()
 - returns all location_groups*
- `map_type< otf2::definition::parameter > & parameters` ()
 - returns all parameters*
- `map_type< otf2::definition::region > & regions` ()
 - returns all regions*
- `map_type< otf2::definition::string > & strings` ()
 - returns all strings*
- `map_type< otf2::definition::system_tree_node > & system_tree_nodes` ()
 - returns all system tree nodes*
- `map_type< otf2::definition::locations_group > & locations_groups` ()
 - returns all groups of locations*
- `map_type< otf2::definition::regions_group > & regions_groups` ()
 - returns all groups of regions*
- `map_type< otf2::definition::comm_locations_group > & comm_locations_groups` ()
 - returns all group of comm locations*
- `map_type< otf2::definition::comm_group > & comm_groups` ()
 - returns all group of comms*
- `map_type< otf2::definition::comm_self_group > & comm_self_groups` ()
 - returns all group of comm selfs*
- `map_type< otf2::definition::metric_member > & metric_members` ()
 - returns all metric members*
- `map_type< otf2::definition::metric_class > & metric_classes` ()
 - returns all metric classes*
- `map_type< otf2::definition::metric_instance > & metric_instances` ()
 - returns all metric instances*
- `map_type< otf2::definition::location_property > & location_properties` ()

- `map_type< otf2::definition::location_group_property > & location_group_properties ()`
returns all location group properties
- `map_type< otf2::definition::system_tree_node_property > & system_tree_node_properties ()`
returns all system tree node properties
- `otf2::chrono::ticks ticks_per_second () const`
returns the ticks per second
- `bool has_clock_properties () const`
returns if clock properties were read from the trace already
- `void set_clock_properties (std::unique_ptr< otf2::definition::clock_properties > &&cp)`
set the clock properties definition You shouldn't call this function
- `const otf2::definition::clock_properties & clock_properties () const`
returns clock properties definition

Friends

- OTF2_CallbackCode `detail::definition::global::location` (void *userData, OTF2_LocationRef self, OTF2_← StringRef name, OTF2_LocationType locationType, uint64_t numberOfEvents, OTF2_LocationGroupRef locationGroup)

9.171.1 Detailed Description

the class for reading in trace files

9.171.2 Constructor & Destructor Documentation

9.171.2.1 `otf2::reader::reader (const std::string & name) [inline]`

constructor Triggers initialization done callback

Parameters

<code>name</code>	the path to the <code>otf2</code> anchor file. Usually traces.otf2 in a score-p trace
-------------------	---

Exceptions

<code>if</code>	it can't open the trace file
-----------------	------------------------------

9.171.2.2 `otf2::reader::reader (reader &) [delete]`

9.171.2.3 `otf2::reader::reader::~reader () [inline]`

destructor

Closes the OTF2_Reader

9.171.3 Member Function Documentation

9.171.3.1 `map_type<otf2::definition::attribute>& otf2::reader::reader::attributes () [inline]`

returns all attributes

This function returns every attribute definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.2 otf2::reader::callback& otf2::reader::reader::callback() [inline]

returns the callback instance

Returns

the instance of the callback

9.171.3.3 const otf2::definition::clock_properties& otf2::reader::reader::clock_properties() const [inline]

returns clock properties definition

9.171.3.4 map_type<otf2::definition::comm_group>& otf2::reader::reader::comm_groups() [inline]

returns all group of comms

This function returns every group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.5 map_type<otf2::definition::comm_locations_group>& otf2::reader::reader::comm_locations_groups() [inline]

returns all group of comm locations

This function returns every group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.6 map_type<otf2::definition::comm_self_group>& otf2::reader::reader::comm_self_groups() [inline]

returns all group of comm selfs

This function returns every group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.7 map_type<otf2::definition::comm>& otf2::reader::reader::comms() [inline]

returns all comms

This function returns every comm definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.8 bool otf2::reader::reader::has_callback() const [inline]

returns true, if a callback was set

Returns

whether a callback was set

9.171.3.9 bool otf2::reader::reader::has_clock_properties() const [inline]

returns if clock properties were read from the trace already

9.171.3.10 map_type<otf2::definition::location_group_property>& otf2::reader::reader::location_group_properties() [inline]

returns all location group properties

This function returns every location property definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.11 map_type<otf2::definition::location_group>& otf2::reader::reader::location_groups() [inline]

returns all location_groups

This function returns every location group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.12 map_type<otf2::definition::location_property>& otf2::reader::reader::location_properties() [inline]

returns all location properties

This function returns every location property definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.13 map_type<otf2::definition::location>& otf2::reader::reader::locations() [inline]

returns all locations

This function returns every location definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.14 const map_type<otf2::definition::location>& otf2::reader::reader::locations() const [inline]

returns all locations in a const context

This function returns every locations definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.15 map_type<otf2::definition::locations_group>& otf2::reader::reader::locations_groups() [inline]

returns all groups of locations

This function returns every group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.16 map_type<otf2::definition::metric_class>& otf2::reader::reader::metric_classes() [inline]

returns all metric classes

This function returns every group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.17 `map_type<otf2::definition::metric_instance>& otf2::reader::reader::metric_instances() [inline]`

returns all metric instances

This function returns every group definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.18 `map_type<otf2::definition::metric_member>& otf2::reader::reader::metric_members() [inline]`

returns all metric members

This function returns every metric member definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.19 `std::uint64_t otf2::reader::reader::num_locations() const [inline]`

returns the number of locations

9.171.3.20 `reader& otf2::reader::operator=(reader &) [delete]`

9.171.3.21 `map_type<otf2::definition::parameter>& otf2::reader::reader::parameters() [inline]`

returns all parameters

This function returns every parameter definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.22 `void otf2::reader::reader::read_definitions() [inline]`

triggers the read of all definition records

For each definition the callback is called.

After all definitions are read, the method [otf2::reader::callback::definitions_done\(\)](#) is called.

9.171.3.23 `void otf2::reader::reader::read_events() [inline]`

triggers the read of all event records

For each event the callback is called.

After all events are read, the method [otf2::reader::callback::events_done\(\)](#) is called.

9.171.3.24 `map_type<otf2::definition::region>& otf2::reader::reader::regions() [inline]`

returns all regions

This function returns every regions definition, which was read until the call of the function. This means there could be missing some. On the other hand it is garantied, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a `otf2::definition::container` which contains all definitions

9.171.3.25 `map_type<otf2::definition::regions_group>& otf2::reader::reader::regions_groups() [inline]`

returns all groups of regions

This function returns every attribute definition, which was read until the call of the function. This means there could be missing some. On the other hand it is garantied, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a `otf2::definition::container` which contains all definitions

9.171.3.26 `void otf2::reader::reader::register_location(otf2::definition::location location) const [inline]`

tells the reader, that it should read the events of the given location

Call this method for every location you want to have the events read.

Defaults to no locations.

Parameters

<code>in</code>	<code>location</code>	the location, for which the events should be read
-----------------	-----------------------	---

9.171.3.27 `void otf2::reader::reader::set_callback(otf2::reader::callback & callback, bool buffered = false) [inline]`

set the given callback as callback for the reader

Parameters

<code>callback</code>	an <code>otf2::reader::callback</code> instance
<code>buffered</code>	if it's set to true, when internally use <code>otf2::event::buffer</code>

9.171.3.28 `void otf2::reader::reader::set_clock_properties(std::unique_ptr<otf2::definition::clock_properties> && cp) [inline]`

set the clock properties definition You shouldn't call this function

Parameters

<code>cp</code>	a unique_ptr to a clock properties definition
-----------------	---

9.171.3.29 map_type<otf2::definition::string>& otf2::reader::reader::strings() [inline]

returns all strings

This function returns every string definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.30 map_type<otf2::definition::system_tree_node_property>& otf2::reader::reader::system_tree_node_properties() [inline]

returns all system tree node properties

This function returns every location property definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.31 map_type<otf2::definition::system_tree_node>& otf2::reader::reader::system_tree_nodes() [inline]

returns all system tree nodes

This function returns every system tree node definition, which was read until the call of the function. This means there could be missing some. On the other hand it is guaranteed, that any referenced definition is already there. So you are safe, when using a returned definition.

Returns

a [otf2::definition::container](#) which contains all definitions

9.171.3.32 otf2::chrono::ticks otf2::reader::reader::ticks_per_second() const [inline]

returns the ticks per second

You should check with [has_clock_properties\(\)](#) if there was a clock properties definition before you rely on this. Otherwise you will get the default of 10^9 ticks per second.

9.171.4 Friends And Related Function Documentation

9.171.4.1 OTF2_CallbackCode detail::definition::global::location(void * userData, OTF2_LocationRef self, OTF2StringRef name, OTF2_LocationType locationType, uint64_t numberOfEvents, OTF2_LocationGroupRef locationGroup) [friend]

9.173 otf2::reference< Type > Class Template Reference

represents a reference number for definitions

```
#include <fwd.hpp>
```

Public Types

- **typedef traits::reference_type< Type >::type ref_type**
ref_type the underlying type of reference numbers

Public Member Functions

- **reference ()=delete**
- **reference (ref_type ref)**
construct by value
- **ref_type get () const**
returns the reference number
- **~reference ()=default**
- **bool is_undefined () const**
returns if the number equals to OTF2_UNDEFINED_UINT64
- **operator ref_type () const**
operator ref_type

Static Public Member Functions

- **template<typename as_type = ref_type>
static ref_type undefined ()**
returns the undefined representing number

9.173.1 Detailed Description

```
template<typename Type>class otf2::reference< Type >
```

represents a reference number for definitions

For each definition should be an own reference type, so the address space is separated in a typesafe manner.

Template Parameters

Type	Used to separate address spaces for different definitions
------	---

9.173.2 Member Typedef Documentation

9.173.2.1 `template<typename Type> typedef traits::reference_type<Type>::type otf2::reference< Type >::ref_type`
 ref_type the underlying type of reference numbers
 Mostly uint64_t or uint32_t

9.173.3 Constructor & Destructor Documentation

9.173.3.1 `template<typename Type> otf2::reference< Type >::reference() [delete]`
 9.173.3.2 `template<typename Type> otf2::reference< Type >::reference(ref_type ref) [inline]`
 construct by value

Parameters

<i>ref</i>	the number
------------	------------

9.173.3.3 `template<typename Type> otf2::reference< Type >::~reference() [default]`

9.173.4 Member Function Documentation

9.173.4.1 `template<typename Type> ref_type otf2::reference< Type >::get() const [inline]`
 returns the reference number

Returns

the reference number

9.173.4.2 `template<typename Type> bool otf2::reference< Type >::is_undefined() const [inline]`
 returns if the number equals to OTF2_UNDEFINED_UINT64

Returns

true or false

9.173.4.3 `template<typename Type> otf2::reference< Type >::operator ref_type() const [inline]`
 operator ref_type
 implicitly convertible to ref_type

9.173.4.4 `template<typename Type> template<typename as_type = ref_type> static ref_type otf2::reference< Type >::undefined() [inline], [static]`
 returns the undefined representing number

Returns

```
OTF2_UNDEFINED_UINT64
```

The documentation for this class was generated from the following files:

- /home/tlsche/vc/haec-sim/include/otf2xx/fwd.hpp
- /home/tlsche/vc/haec-sim/include/otf2xx/reference.hpp

9.174 otf2::reference_generator< RefType > Class Template Reference

gives a free reference number for a set of definitions

```
#include <fwd.hpp>
```

Public Types

- `typedef RefType ref_type`

Public Member Functions

- `template<typename Definition>`
`void register_definition (Definition def)`
- `void register_reference (ref_type ref)`
- `ref_type next ()`

9.174.1 Detailed Description

```
template<typename RefType>class otf2::reference_generator< RefType >
```

gives a free reference number for a set of definitions

This class generates free reference numbers for definitions. For this task, it needs to know every used reference number first.

Therefore you need to register every definition.

Note

The algorithm for generating a number is undefined.

Template Parameters

<i>Definition</i>	The definition for which it should generate numbers
-------------------	---

9.174.2 Member Typedef Documentation

9.174.2.1 template<typename RefType> typedef RefType otf2::reference_generator< RefType >::ref_type

9.195.1 Detailed Description

class for representing a region definition

9.195.2 Member Typedef Documentation

9.195.2.1 `typedef impl_type::flags_type otf2::definition::region::flags_type`

9.195.2.2 `typedef impl_type::paradigm_type otf2::definition::region::paradigm_type`

9.195.2.3 `typedef impl_type::role_type otf2::definition::region::role_type`

9.195.3 Constructor & Destructor Documentation

9.195.3.1 `otf2::definition::region (otf2::reference< region > ref, otf2::definition::string name, otf2::definition::string canonical_name, otf2::definition::string description, role_type role, paradigm_type paradigm, flags_type flags, otf2::definition<::string source_file, uint32_t begin_line, uint32_t end_line) [inline]`

9.195.3.2 `otf2::definition::region () [default]`

9.195.4 Member Function Documentation

9.195.4.1 `uint32_t otf2::definition::region::begin_line () const [inline]`

returns the line number, where the region starts

9.195.4.2 **otf2::definition::string** otf2::definition::region::canonical_name() const [inline]

returns the canonical name of the region definition as a string definition e.g. demangled function name

Returns

a [string](#) definiton containing the canonical name

9.195.4.3 **otf2::definition::string** otf2::definition::region::description() const [inline]

returns the description of the region definion as a string definition

Returns

a [string](#) definiton containing the description

9.195.4.4 **uint32_t** otf2::definition::region::end_line() const [inline]

returns the line number, where the region ends

9.195.4.5 **flags_type** otf2::definition::region::flags() const [inline]

returns the flags of this region

See also

[otf2::common::flags_type](#)

9.195.4.6 **otf2::definition::string** otf2::definition::region::name() const [inline]

returns the name of the region definion as a string definition

Returns

a [string](#) definiton containing the name

9.195.4.7 **paradigm_type** otf2::definition::region::paradigm() const [inline]

returns the paradigm of this region

See also

[otf2::common::paradigm_type](#)

9.195.4.8 **role_type** otf2::definition::region::role() const [inline]

returns the role of this region

See also

[otf2::common::role_type](#)

9.195.4.9 otf2::definition::string otf2::definition::region::source_file () const [inline]

returns the name of file containing the region definion as a string definition

Returns

a [string](#) definiton containing the file name

definition handler for string definition
- virtual void `definition (otf2::definition::system_tree_node definition) override`
definition handler for system tree node definition
- virtual void `definition (otf2::definition::clock_properties definition) override`
definition handler for clock properties definition
- virtual void `definition (otf2::definition::metric_class definition) override`
definition handler for metric class definition
- virtual void `definition (otf2::definition::metric_member definition) override`
definition handler for metric member definition
- virtual void `definition (otf2::definition::metric_instance definition) override`
definition handler for metric instance definition
- virtual void `definition (otf2::definition::system_tree_node_property definition) override`
definition handler for system tree node property definition
- virtual void `definition (otf2::definition::location_property definition) override`
definition handler for location property definition
- virtual void `definition (otf2::definition::location_group_property definition) override`
definition handler for location group property definition
- `otf2::definition::container< otf2::definition::location > & locations ()`
getter for all cached location definitions
- virtual void `definitions_done (const otf2::reader::reader &rdr) override`
- virtual void `events_done (const otf2::reader::reader &) override`
handler for the events read notification

Additional Inherited Members

9.205.1 Detailed Description

The sink class.

This class is the last one in the chain of `haec_sim` modules. It writes the incoming definitions and events to a new trace.

9.205.2 Constructor & Destructor Documentation

9.205.2.1 `haec_sim::module::sink::sink() [delete]`

9.205.2.2 `haec_sim::module::sink::sink(std::string path, std::string name, boost::mpi::communicator comm, haec_sim::topology::topology & t) [inline]`

constructor

Parameters

<i>path</i>	The path of the new trace
<i>name</i>	The name of the new trace
<i>comm</i>	The Boost.MPI Communicator for this module

9.205.3 Member Function Documentation**9.205.3.1 otf2::writer::archive& haec_sim::module::sink::archive() [inline]**

retuns underlying archive

Returns

the archive

9.205.3.2 const otf2::writer::archive& haec_sim::module::sink::archive() const [inline]

retuns underlying archive

Returns

the archive

9.205.3.3 virtual void haec_sim::module::sink::definition(otf2::definition::attribute *definition*) [inline], [override], [virtual]

definition handler for attribute definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).**9.205.3.4 virtual void haec_sim::module::sink::definition(otf2::definition::comm *definition*) [inline], [override], [virtual]**

definition handler for comm definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).**9.205.3.5 virtual void haec_sim::module::sink::definition(otf2::definition::locations_group *definition*) [inline], [override], [virtual]**

definition handler for group of locations definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.6 `virtual void haec_sim::module::sink::definition(otf2::definition::regions_group definition) [inline], [override], [virtual]`

definition handler for group of regions definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.7 `virtual void haec_sim::module::sink::definition(otf2::definition::comm_locations_group definition) [inline], [override], [virtual]`

definition handler for metric group definition

Parameters

<i>definition</i>	the definition definition handler for comm location group definition
<i>definition</i>	the definition

Reimplemented from [haec_sim::module::base](#).

9.205.3.8 `virtual void haec_sim::module::sink::definition(otf2::definition::comm_group definition) [inline], [override], [virtual]`

definition handler for comm group definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.9 `virtual void haec_sim::module::sink::definition(otf2::definition::comm_self_group definition) [inline], [override], [virtual]`

definition handler for comm self group definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.10 `virtual void haec_sim::module::sink::definition(otf2::definition::location location) [inline], [override], [virtual]`

definition handler for location definition

Parameters

<i>location</i>	the location definition
-----------------	-------------------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.11 `virtual void haec_sim::module::sink::definition (otf2::definition::location_group definition) [inline], [override], [virtual]`

definition handler for location group definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.12 `virtual void haec_sim::module::sink::definition (otf2::definition::parameter definition) [inline], [override], [virtual]`

definition handler for parameter definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.13 `virtual void haec_sim::module::sink::definition (otf2::definition::region definition) [inline], [override], [virtual]`

definition handler for region definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.14 `virtual void haec_sim::module::sink::definition (otf2::definition::string definition) [inline], [override], [virtual]`

definition handler for string definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.15 `virtual void haec_sim::module::sink::definition (otf2::definition::system_tree_node definition) [inline], [override], [virtual]`

definition handler for system tree node definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.16 virtual void haec_sim::module::sink::definition (**otf2::definition::clock_properties definition**)
[inline], [override], [virtual]

definition handler for clock properties definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.17 `virtual void haec_sim::module::sink::definition(otf2::definition::metric_class definition) [inline], [override], [virtual]`

definition handler for metric class definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.18 `virtual void haec_sim::module::sink::definition(otf2::definition::metric_member definition) [inline], [override], [virtual]`

definition handler for metric member definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.19 `virtual void haec_sim::module::sink::definition(otf2::definition::metric_instance definition) [inline], [override], [virtual]`

definition handler for metric instance definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.20 `virtual void haec_sim::module::sink::definition(otf2::definition::system_tree_node_property definition) [inline], [override], [virtual]`

definition handler for system tree node property definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.21 `virtual void haec_sim::module::sink::definition(otf2::definition::location_property definition) [inline], [override], [virtual]`

definition handler for location property definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.22 `virtual void haec_sim::module::sink::definition(otf2::definition::location_group_property definition) [inline], [override], [virtual]`

definition handler for location group property definition

Parameters

<i>definition</i>	the definition
-------------------	----------------

Reimplemented from [haec_sim::module::base](#).

9.205.3.23 `virtual void haec_sim::module::sink::definitions_done(const otf2::reader::reader & rdr) [inline], [override], [virtual]`

This callback gets called after the otf::reader::reader has finished reading all definition records

Reimplemented from [otf2::reader::callback](#).

9.205.3.24 `virtual void haec_sim::module::sink::event(otf2::definition::location location, const otf2::event::buffer_flush & event) [inline], [override], [virtual]`

event handler for buffer flush event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.25 `virtual void haec_sim::module::sink::event(otf2::definition::location location, const otf2::event::enter & event) [inline], [override], [virtual]`

event handler for enter event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.26 `virtual void haec_sim::module::sink::event(otf2::definition::location location, const otf2::event::leave & event) [inline], [override], [virtual]`

event handler for leave event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.27 virtual void haec_sim::module::sink::event (**otf2::definition::location** *location*, const **otf2::event::measurement & event**) [inline], [override], [virtual]

event handler for measurement event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.28 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::metric & event) [inline], [override], [virtual]`

event handler for metric event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.29 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::mpi_send & event) [inline], [override], [virtual]`

event handler for mpi send event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.30 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::mpi_receive & event) [inline], [override], [virtual]`

event handler for mpi receive event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.31 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::mpi_isend & event) [inline], [override], [virtual]`

event handler for mpi isend event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.32 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::mpi_isend_complete & event) [inline], [override], [virtual]`

event handler for mpi isend complete event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.33 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::mpi_ireceive & *event*) [inline], [override], [virtual]

event handler for mpi ireceive event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.34 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::mpi_ireceive_request & *event*) [inline], [override], [virtual]

event handler for mpi ireceive complete event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.35 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::mpi_request_test & *event*) [inline], [override], [virtual]

event handler for mpi request test event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.36 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::mpi_request_cancelled & *event*) [inline], [override], [virtual]

event handler for mpi request cancelled event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.37 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::mpi_collective_begin & *event*) [inline], [override], [virtual]

event handler for mpi collective begin event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.38 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::mpi_collective_end & event) [inline], [override], [virtual]`

event handler for mpi collective end event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.39 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::parameter_string & event) [inline], [override], [virtual]`

event handler for parameter string event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.40 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::parameter_int & event) [inline], [override], [virtual]`

event handler for paramter int event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.41 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::parameter_unsigned_int & event) [inline], [override], [virtual]`

event handler for paramter unsigned int event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.42 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::thread_fork & event) [inline], [override], [virtual]`

event handler for thread fork event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.43 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::thread_join & event) [inline], [override], [virtual]`

event handler for thread join event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.44 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::thread_team_begin & event) [inline], [override], [virtual]`

event handler for thread team begin event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.45 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::thread_team_end & event) [inline], [override], [virtual]`

event handler for thread team end event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.46 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::thread_acquire_lock & event) [inline], [override], [virtual]`

event handler for thread acquire lock event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.47 `virtual void haec_sim::module::sink::event (otf2::definition::location location, const otf2::event::thread_release_lock & event) [inline], [override], [virtual]`

event handler for thread release lock event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.48 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::thread_task_create & *event*) [inline], [override], [virtual]

event handler for thread task switch event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.49 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::thread_task_switch & *event*) [inline], [override], [virtual]

event handler for thread task switch event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.50 virtual void haec_sim::module::sink::event (otf2::definition::location *location*, const otf2::event::thread_task_complete & *event*) [inline], [override], [virtual]

event handler for thread task complete event

Parameters

<i>location</i>	the location of the event
<i>event</i>	the event

Reimplemented from [haec_sim::module::base](#).

9.205.3.51 virtual void haec_sim::module::sink::events_done (const otf2::reader::reader &) [inline], [override], [virtual]

handler for the events read notification

This handler is called, after all events has passed the pipeline

Reimplemented from [haec_sim::module::base](#).

9.205.3.52 otf2::definition::container<otf2::definition::location>& haec_sim::module::sink::locations () [inline]

getter for all cached location definitions

Locations must be cached, as they depends on the number of events, which could be changed during the runtime of the simulator.

Returns

a map of all cached locations

The documentation for this class was generated from the following file:

9.207 `haec_sim::module::source` Class Reference

This first module in the chain of modules processing trace files.

```
#include <source.hpp>
```

Inheritance diagram for haec_sim::module::source:

Public Member Functions

- `source (boost::mpi::communicator comm, haec_sim::topology::topology &t)`
usual constructor
- `virtual void definition (otf2::definition::location definition) override`
callback for location definitions
- `virtual void definitions_done (const otf2::reader::reader &rdr) override`
This callback gets called after the otf::reader::reader has finished reading all definition records.
- `virtual void definition (otf2::definition::unknown) override`
- `virtual void event (otf2::definition::location loc, const otf2::event::unknown &e) override`

Additional Inherited Members

9.207.1 Detailed Description

This first module in the chain of modules processing trace files.

This class tells the `otf2::reader::reader` the locations, for which it should read the events. It also checks for the correct number of simulation processes, such that each location has its own process

9.207.2 Constructor & Destructor Documentation

9.207.2.1 `haec_sim::module::source::source (boost::mpi::communicator comm, haec_sim::topology::topology & t)` [inline]

usual constructor

Parameters

<code>comm</code>	- the desired communicator for this module
-------------------	--

9.207.3 Member Function Documentation

9.207.3.1 `virtual void haec_sim::module::source::definition (otf2::definition::location definition)` [inline], [override], [virtual]

callback for location definitions

Parameters

<i>definition</i>	the location definition
-------------------	-------------------------

Reimplemented from [haec_sim::module::base](#).

9.207.3.2 virtual void haec_sim::module::source::definition (otf2::definition::unknown) [inline], [override], [virtual]

Reimplemented from [otf2::reader::callback](#).

9.207.3.3 virtual void haec_sim::module::source::definitions_done (const otf2::reader::reader & rdr) [inline], [override], [virtual]

This callback gets called after the otf::reader::reader has finished reading all definition records.

Tells the [otf2::reader::reader](#) which local event reader should be opened.

Reimplemented from [otf2::reader::callback](#).

9.207.3.4 virtual void haec_sim::module::source::event (otf2::definition::location *loc*, const otf2::event::unknown & *e*) [inline], [override], [virtual]

Reimplemented from [otf2::reader::callback](#).

operator std::string

Additional Inherited Members

9.211.1 Detailed Description

The string definiton class.

This class represents an OTF2 string definition.

9.211.2 Constructor & Destructor Documentation

9.211.2.1 `otf2::definition::string::string(otf2::reference< string > ref, const std::string & str) [inline]`

value constructor

Takes the reference number and value for this definition.

Parameters

<code>ref</code>	reference number
<code>str</code>	string value

9.211.2.2 `otf2::definition::string::string() [default]`

9.211.3 Member Function Documentation

9.211.3.1 `otf2::definition::string::operator std::string() const [inline], [explicit]`

operator std::string

A string definition is explicit convertible to a std::string

9.211.3.2 `const std::string& otf2::definition::string::str() const [inline]`

returns string value as const ref

Returns

the value

The documentation for this class was generated from the following file:

- /home/tilsche/vc/haec-sim/include/otf2xx/definition/string.hpp

9.213 nitro::dl::symbol< T > Class Template Reference

Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way.

```
#include <symbol.hpp>
```

9.213.1 Detailed Description

```
template<typename T>class nitro::dl::symbol< T >
```

Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way.

This nice trick to get return and argument types out of the instantiation with 'symbol<Ret(Args...)>' is copied from std::function :-)

The documentation for this class was generated from the following file:

- `/home/tolsche/vc/haec-sim/include/nitro/dl/symbol.hpp`

9.214 nitro::dl::symbol< Ret(Args...)> Class Template Reference

Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way.

```
#include <symbol.hpp>
```

Public Member Functions

- `symbol (std::shared_ptr< void > library, const std::string &name)`
Constructor for a symbol.
- `Ret operator() (Args...args)`
Typesafe call of dynamic loaded function.

9.214.1 Detailed Description

```
template<typename Ret, typename... Args>class nitro::dl::symbol< Ret(Args...)>
```

Class for holding and calling a handler to a dynamically loaded symbol in a typesafe way.

Attention

Don't let the parental object of type `nitro::dl::dl` go out of scope. This will fuck up everything.

9.214.2 Constructor & Destructor Documentation

```
9.214.2.1 template<typename Ret , typename... Args> nitro::dl::symbol< Ret(Args...)>::symbol ( std::shared_ptr< void > library, const std::string & name ) [inline]
```

Constructor for a symbol.

This constructor gets called by the parental dl instance. You should not call it yourself.

Parameters

<code>library</code>	the pointer to the <code>nitro::dl::dl</code> instance
<code>name</code>	the name of the symbol which is to be called

9.214.3 Member Function Documentation

```
9.214.3.1 template<typename Ret , typename... Args> Ret nitro::dl::symbol< Ret(Args...)>::operator() ( Args... args ) [inline]
```

Typesafe call of dynamic loaded function.

The documentation for this class was generated from the following file:

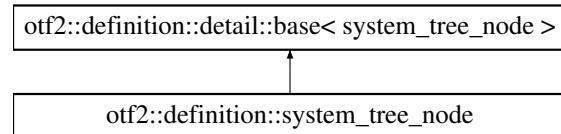

- /home/tilsche/vc/haec-sim/include/nitro/dl/[symbol.hpp](#)

9.215 otf2::definition::system_tree_node Class Reference

class for representing system tree node definitions

```
#include <system_tree_node.hpp>
```

Inheritance diagram for otf2::definition::system_tree_node:

Public Member Functions

- `system_tree_node (reference< system_tree_node > ref, otf2::definition::string name, otf2::definition::string class_name, otf2::definition::system_tree_node parent)`
- `system_tree_node (reference< system_tree_node > ref, otf2::definition::string name, otf2::definition::string class_name)`
- `system_tree_node ()=default`
- `otf2::definition::string name () const`
returns the name of the system tree node definion as a string definition
- `otf2::definition::string class_name () const`
returns the class name of the system tree node definion as a string definition
- `bool has_parent () const`
returns whether the definition has got a parent or not
- `otf2::definition::system_tree_node parent () const`
returns the parent

Additional Inherited Members

9.215.1 Detailed Description

class for representing system tree node definitions

9.215.2 Constructor & Destructor Documentation

9.215.2.1 `otf2::definition::system_tree_node::system_tree_node (reference< system_tree_node > ref, otf2::definition::string name, otf2::definition::string class_name, otf2::definition::system_tree_node parent) [inline]`

9.215.2.2 `otf2::definition::system_tree_node::system_tree_node (reference< system_tree_node > ref, otf2::definition::string name, otf2::definition::string class_name) [inline]`

9.215.2.3 `otf2::definition::system_tree_node::system_tree_node () [default]`

9.215.3 Member Function Documentation

9.215.3.1 `otf2::definition::string otf2::definition::system_tree_node::class_name () const [inline]`

returns the class name of the system tree node definion as a string definition

Returns

a string definiton containing the class name

9.215.3.2 `bool otf2::definition::system_tree_node::has_parent () const [inline]`

returns whether the definition has got a parent or not

9.215.3.3 otf2::definition::string otf2::definition::system_tree_node::name() const [inline]

returns the name of the system tree node definition as a string definition

Returns

a string definition containing the name

9.215.3.4 otf2::definition::system_tree_node otf2::definition::system_tree_node::parent() const [inline]

returns the parent

Returns

[otf2::definition::system_tree_node](#)

Exceptions

if	there is no parent
----	--------------------

9.233 haec_sim::topology::topology Class Reference

The topology class represents the layout of positions in a 3D-Mesh.

```
#include <topology.hpp>
```

Public Types

- enum `topology_type` { `topology_type::mesh`, `topology_type::torus` }

Public Member Functions

- `topology (haec_sim::config::config conf)`
topology constructor
- `topology (haec_sim::topology::position size, topology_type type)`
- `size_t num_nodes () const`
returns the number of nodes in the current topology
- `position_iterator begin () const`
returns an iterator to the first node in the topology
- `position_iterator end () const`
returns an iterator past the last node in the topology
- `bool contains (position pos) const`
Returns true if the given position is a valid position inside the topology.
- `haec_sim::topology::position size () const`
returns the size of the topology
- `haec_sim::topology::position get_position (otf2::definition::location loc) const`
returns the position of a given location
- `haec_sim::topology::position add (otf2::definition::location loc)`
Adds a location to the topology.
- `haec_sim::path::data_transfer_path get_path (const haec_sim::topology::position fromPos, const haec_sim::topology::position toPos) const`
returns a path between given positions
- template<typename Manager , typename... Args>
`void replace_manager (Args...args)`
replaces the current manager
- `haec_sim::path::data_transfer_path get_path (otf2::definition::location from, otf2::definition::location to) const`
returns a path between given positions
- `topology_type type () const`

9.233.1 Detailed Description

The topology class represents the layout of positions in a 3D-Mesh.

9.233.2 Member Enumeration Documentation

9.233.2.1 enum haec_sim::topology::topology::topology_type [strong]

Enumerator

`mesh`
`torus`

9.233.3 Constructor & Destructor Documentation

9.233.3.1 haec_sim::topology::topology (haec_sim::config::config conf) [inline]

topology constructor

Parameters

<code>size</code>	the size of the topology
-------------------	--------------------------

It will also try to initialize the SimulatorTopologyManager

9.233.3.2 haec_sim::topology::topology::topology (haec_sim::topology::position *size*, topology_type *type*) [inline]

9.233.4 Member Function Documentation

9.233.4.1 haec_sim::topology::position haec_sim::topology::topology::add (otf2::definition::location *loc*) [inline]

Adds a location to the topology.

Parameters

<code>loc</code>	the added location
------------------	--------------------

Returns

the position for the given location

This function relies on the choosed SimulatorTopologyManager. This might be the MappingFileSimulatorTopologyManager, then position mapping will be loaded from the postions.map file. Or it could be the DepthFirstSimulatorTopologyManager, then locations will be mapped in a depth first order.

9.233.4.2 position_iterator haec_sim::topology::topology::begin () const [inline]

returns an iterator to the first node in the topology

Note

: Be advised, that there's no garanty for a certain order

9.233.4.3 bool haec_sim::topology::topology::contains (position *pos*) const [inline]

Returns true if the given position is a valid position inside the topology.

Parameters

<code>pos</code>	the position to be checked
------------------	----------------------------

Returns

true, if the position is part of the topology

9.233.4.4 position_iterator haec_sim::topology::topology::end () const [inline]

returns an iterator past the last node in the topology

Note

: Be advised, that there's no garanty for a certain order

```
9.233.4.5 haec_sim::path::data_transfer_path haec_sim::topology::topology::get_path ( const  
haec_sim::topology::position fromPos, const haec_sim::topology::position toPos ) const  
[inline]
```

returns a path between given positions

Parameters

<i>fromPos</i>	the starting position
<i>toPos</i>	the endpoint

Returns

the path

9.233.4.6 haec_sim::path::data_transfer_path haec_sim::topology::topology::get_path (otf2::definition::location *from*, otf2::definition::location *to*) const [inline]

returns a path between given positions

Parameters

<i>from</i>	the starting location
<i>to</i>	the end location

Returns

the path

9.233.4.7 haec_sim::topology::position haec_sim::topology::topology::get_position (otf2::definition::location *loc*) const [inline]

returns the position of a given location

Parameters

<i>loc</i>	the location
------------	--------------

Returns

the position for the location

9.233.4.8 size_t haec_sim::topology::topology::num_nodes () const [inline]

returns the number of nodes in the current topology

Returns

the number of nodes

9.233.4.9 template<typename Manager , typename... Args> void haec_sim::topology::topology::replace_manager (Args... args) [inline]

replaces the current manager

Parameters

<i>args</i>	The arguments to the constructor of Manager
<i>Manager</i>	the type of the manager

9.233.4.10 `haec_sim::topology::position haec_sim::topology::topology::size() const [inline]`

returns the size of the topology

Returns

the size of the topology

9.233.4.11 `topology_type haec_sim::topology::topology::type() const [inline]`

The documentation for this class was generated from the following file:

- /home/tilsche/vc/haec-sim/include/haec_sim/topology/[topology.hpp](#)

9.234 `haec_sim::trace_file` Class Reference

an abstraction of traces

```
#include <environment.hpp>
```

Public Member Functions

- `trace_file(std::string directory, std::string filename)`
returns absolut path of trace folder
- `trace_file(std::string full_path)`
returns absolut path of trace anchor file
- `const std::string & folder() const`
returns name of the anchor file, without extension
- `std::string anchor_file() const`
returns absolute path of a given filename in the trace directory
- `std::string anchor_name() const`
returns name of the anchor file, without extension
- `std::string file(std::string filename) const`
returns absolute path of a given filename in the trace directory

9.234.1 Detailed Description

an abstraction of traces

9.234.2 Constructor & Destructor Documentation

9.234.2.1 `haec_sim::trace_file::trace_file(std::string directory, std::string filename) [inline]`

9.234.2.2 `haec_sim::trace_file::trace_file(std::string full_path) [inline]`

9.234.3 Member Function Documentation

9.234.3.1 `std::string haec_sim::trace_file::anchor_file() const [inline]`

returns absolut path of trace anchor file

9.234.3.2 `std::string haec_sim::trace_file::anchor_name() const [inline]`

returns name of the anchor file, without extension

9.234.3.3 `std::string haec_sim::trace_file::file(std::string filename) const [inline]`

returns absolute path of a given filename in the trace directory

e.g. if your trace anchor file is /home/foo/trace/traces.[otf2](#) then file("bar.txt") will return /home/foo/trace/bar.txt

9.234.3.4 `const std::string& haec_sim::trace_file::folder() const [inline]`

returns absolute path of trace folder

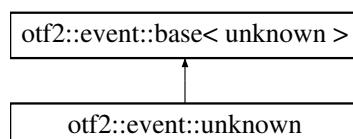

The documentation for this class was generated from the following file:
